

SiteReporter 4.0

copyright © 1999 coolmaps.com inc

Getting Started

SiteReporter 4.0 is a very powerful new component made possible by Fusion 4.0's extended API.

It automatically generates a report on your site, detailing both site and page information. e.g. total size of site, download time for site, page, images and links used per page. It also details the effect of caching, and calculate speeds based on that!

To get started with SiteReporter:

- Run the SiteReporter Installation program, specifying the location of Fusion 4.0's component directory.
- Launch Fusion

SiteReporter is a 'post publish' component. It does not appear on the coolmaps.com component bar in Page view. SiteReporter is enabled in Publish View.

- Choose Publish View > Set Up > Components

Publish Setup
