KRIEGSPIEL ENGINEER BOWLING METEOR STORM MAD SCIENTIST ADVENTURE

PLUS!

**Data Base Sorting Routines,
Graphics Rotations, Game Design,
Programming Hints and more.**

Apparat, Inc.
introduces

NEWDOS/80

For the 80's —
an enhanced NEWDOS
for your TRS-80™
Model 1.

NEWDOS/80

Brand new from Apparat, their most powerful DOS ever. EVERYTHING in NEWDOS and NEWDOS+ and more: Variable length records (up to 4095 bytes), mix or match your disk drives: 35, 40 and 77 track drives can be used in any combination — even with 8 inch drives, new security boot-up sequence makes it impossible for the unauthorized to BREAK or LIST. "DOS READY" and "READY" need never appear, enhanced RENUMBER allows relocation of subroutines, powerful program CHAINing, option to PRINT on display and printer simultaneously, execute DOS commands — from DOS — without disturbing your resident BASIC program. Put the "DOS of the Eighties" to work for you. On disk, with all documentation. **\$149.95**

NEWDOS

NEWDOS corrects over 70 errors and omissions in TRSDOS 2.1 and disk BASIC, yet they are completely compatible! Programs SAVED under either system need no modification to work with the other. Like going from Level I to Level II: more power, convenience and speed. Use all DOS commands (DIR, FREE, RENAME, COPY etc.) from BASIC, AUTO LOAD and RUN a BASIC program from power-up, produce variable and constant cross reference tables, OPEN "E" to add to the end of a sequential file, send whatever is on the screen to your printer, even in DOS (great for DIR), renumber BASIC programs, and more . . . Fully documented; available on disk for only **\$49.95**

NEWDOS PLUS

ALL of the above PLUS: Editor/Assembler for disk, Z-80 Disassembler, LMOFFSET to relocate and save SYSTEM tapes to disk, Level I BASIC language with disk I/O, DIRCHECK to check and LIST disk directory, SUPERZAP—display/print/modify any location in RAM or on disk (worth the price of the entire package when you resurrect that accidentally KILLED file!). NEWDOS+ on disk with documentation, just **\$99.95**

Our signature of quality.

TSE began in the basement of our publisher's home. In those days we did everything from reviewing submissions, writing documentation, and duplicating cassettes, to licking envelopes. There was correspondence with the authors, telephoning, equipment problems, authors' contract negotiations and more and more envelopes which needed stamps.

TSE explored the 'software' territory in those 'frontier days' carefully . . . scouting out only the very best, leaving the weaker pieces by the roadside. The number of submissions was increasing, and we had all that we could do to provide proper service for our customers. We decided then and there that we would publish only 'the' very finest software available and commit ourselves to a policy of 'selectivity' and strong customer service.

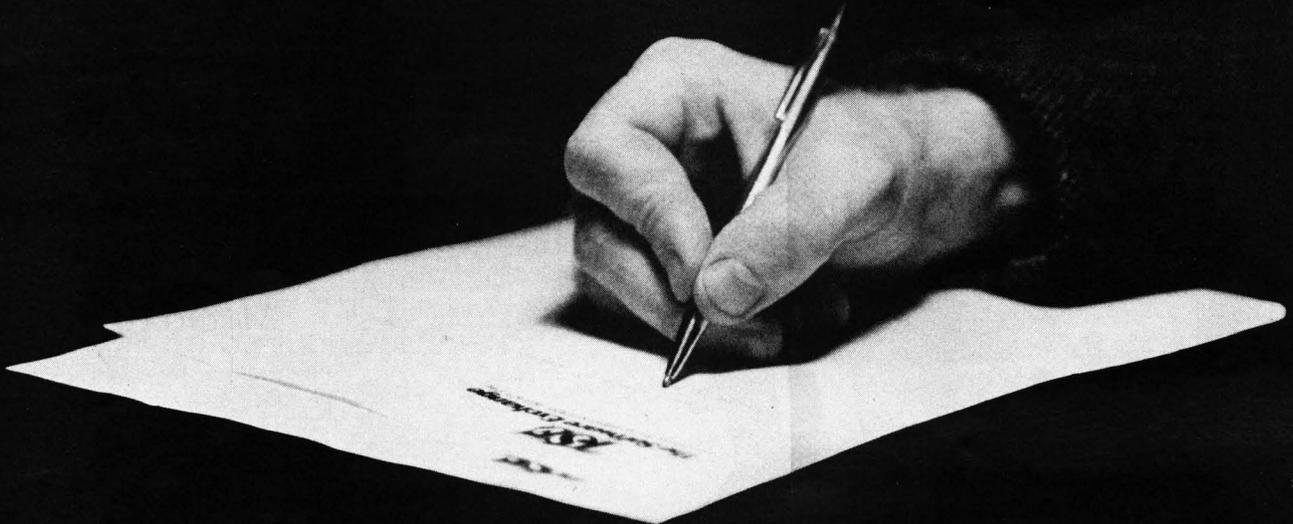

Well, it worked . . . Since those days in the basement we have grown from a Mom and Pop operation with a dozen software titles to a company with 40 employees and over 500 titles. TSE distributes software for over 50 different vendors. We considered ourselves 'pioneers,' and as such we learned many things about our business and about our customers. We've made mistakes . . . who hasn't, however, the two most important factors in our success have been a keen eye towards selecting good software and a commitment towards strong customer support.

We think that you will profit from TSE's experiences and come to find a consistency in product selection and a mandate to continued customer service in the months and years ahead.

A Microsoft Adventure for the TRS-80 and Apple.

Here is the granddaddy of the computer Adventure games. Microsoft Adventure, from the people who wrote BASIC for personal computers, places you in "Colossal Cave," where both treasures and perils abound! Here you can find gold, silver, jewelry, magic items, and precious pottery. But you may also find threatening dwarves, trolls, large green snakes and a giant oyster. Meet the pirate and the computer wizard. See the volcano and sulphur lakes.

As you become more skilled in overcoming obstacles and avoiding hazards, more regions of the cave will open up to you. Keep your wits about you and you may eventually become a Grand Master. Slip up and you may not become anything, if that. It all depends upon your ability and your ingenuity.

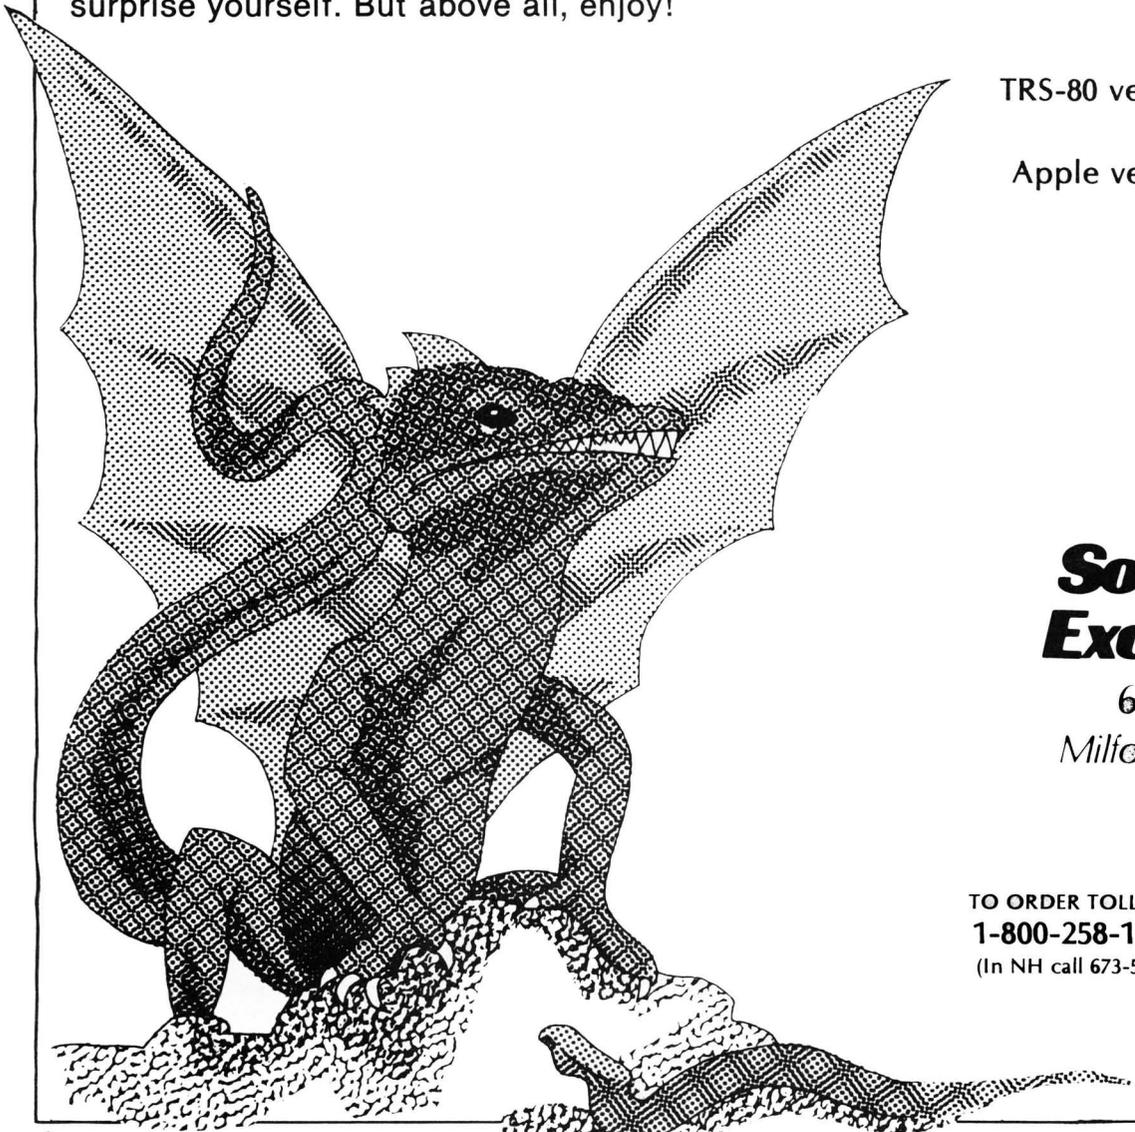

When your adventure begins, you will find yourself outside of the cave. From there on in you must tell the computer what you wish to do by means of one- or two-word commands. Sometimes the computer might offer to help you with a small hint, but remember, there's no free lunch! You will have to do most of the work, including learning to use magic, yourself. Look for allies in unexpected places and you might surprise yourself. But above all, enjoy!

It's funny how software developed on various microcomputers differ in style. Some of the most challenging games are created on the TRS-80, the machine with the fewest game-type options, as opposed to the Apple, Atari, and other flashier machines. The TRS-80, it turns out, has the most capable version of BASIC of all the home computers (except, perhaps the Heaths). Level II BASIC offers IF—THEN—ELSE, VARPTR, STRING\$, and a nicer RND function than the other machines, all of which greatly simplifies the logic of programming. All of the DOS commands are included in the TRS-80's Disk BASIC. Compare that with the Apple's bizarre-looking PRINT D\$ commands. Most of the programs we see for the color computers seem to be hung up on graphics and sound, and aren't very deep in logic. There are always exceptions, and most of the commercial programs now available are improvements over the all-flash approach of earlier software. A majority of the really interesting software, however, comes in for the TRS-80. I've even seen many instances where program graphics are immensely more creative on the TRS-80, with its SET-RESET graphics, than on the others that have multiple graphic statements. For example, Android Nim, originally for the TRS-80, Dancing Demon, and even Imhotep, for which we published concurrent Apple and TRS-80 versions last month, all make unbelievable use of what most people would consider very limited graphics capabilities. (For those of you who think I may be speaking out of a bias toward the TRS-80; I'm not. I own an Apple myself, on which I do almost all of my programming. I'm even using an Apple word processor, Super-Text, for writing this.) The whole point is the flashier the system, the more that people seem to get caught up in the flash rather than in the actual art of programming.

Programming in itself can be a real art. One of the most interesting ideas I've seen in a long time was the One-Liner idea from Arne Rohde. We printed his original letter in the July **S-80 SoftSide** and have since been running One-Liners as a regular feature. In trying to condense an idea to a program of only one line you can discover much about the intricacies of the computer language you use. As an example, I'd never really taken much time worrying about converting Apple Integer BASIC programs that frequently used the MOD function to Applesoft. The MOD function is somewhat unique to Integer BASIC, returning a value that is the remainder after division. (13 mod 10 is 3, 7 and 2 is 1, etc.) The best conversion of the MOD function I had seen was as a function definition (DEF FN) published in Call A.P.P.L.E. Then I came upon a One-Liner by Dennis Ward (in this issue) in which was buried a technique that did much the same thing much more easily (A-500x(A 500)), which is similar to a MOD 500. A 500 has the value 1 if true, 0 if false. Actually, this 'MOD' function works only if A is between 0 and 999 and doesn't give the proper result when A equals 500. A true MOD function is: A-INT(A/500)*500). Nifty, though, the techniques discovered when necessity is involved. Then there's the One-Liner we received from Will Evans a couple of days before this issue went to press. It's basically a one-line version of the Meteor Storm programs featured this month. Although it's a stripped down version, it even keeps score. (It's sometimes difficult to keep up with all the advances in the computer field.) I've talked to a lot of people who lament the lack of software available for certain systems (the Heath computers, Exidy Sorcerer, PET, TI 99/4, . . .) Unfortunately, a rule often learned too late is that one should check out the kinds of software available for a machine

before investing in the hardware. it's not that anyone is necessarily ignoring a particular machine; if someone is going to invest a lot of time or money into developing or promoting software, it's got to be able to provide a return. There just aren't enough TI 99/4s out there yet for people to justify development time and expense. Of course it's an obvious Catch-22: If the software's not there, people won't buy the machine; and if the machine hasn't sold very much, people won't develop the software.

There is even quite a waiting period involved, about a year, from the time a system is reasonably accepted to the time significant software products become available. The Atari 800, which has recently been doing quite well, is now a little over a year old and a range of good quality software is just now

beginning to appear. I predict that a year from now the variety of Atari software will have caught up to the current levels of the Apple and TRS-80. It looks like the Heath computers may be just starting that cycle.

I've also had calls from people complaining that after they'd bought software packages, they couldn't make backup copies of the programs. Unfortunately, that's a side effect of piracy. Although it's a great convenience -sometimes a necessity - to backup important disks, software companies simply cannot afford to allow copiable disks to be sold. For each one sold that can be duplicated, maybe five or ten will be illegally copied for friends or acquaintances, especially for the really good programs that are in demand. That severely cuts into a company's profit margin, enough

so that they'd be foolish to voluntarily let it happen. So when you buy a commercial program, assume that it can't be duplicated. If it can, let it be a pleasant surprise - and try not to do your friends any favors.

We'd like to welcome another full time editor to our staff this month. Phil Case just arrived from the depths of Missouri with some more TRS-80 and Apple expertise. He promptly wrote a one line adventure. Hmmm. Also, if you've noticed that our grammar and spelling have improved, it's probably due to Dave Albert, who's been assigned the task of taking the miscellaneous atrocities we produce and getting them into reasonable shape before we turn them in to the Art Department. It's been a great help.

Mark Pelczarski

ABOUT THIS ISSUE:

Due to the noted absence of that Magnificent Penguin, we editorial munchkins are going to tell you about what lies between the covers this month. Don't be alarmed if the voice sounds different.

To begin with, that piece of machinery on the cover is merely there to indicate that the guru of computer wargamers, Ron Potkin, has decided to let us all in on the secret workings of his Kriegspiel program. Furthermore, he has graced our pages with another spiel, this one on game design. A tip of our stocking caps to you, Ron!

For you Appleheads, our very own Phil Case has slipped another one in! Bowling. Phil is from Missouri, so we had to show him how you really bowl. . .he still hasn't come to accept candlepins, though. Give him time.

And then there's Bouncing Barney, the madcap trampolinist who can't seem to stay away from the floor. . .he needs you.

Plus it's raining meteors this issue, and there's a mad scientist lurking about, complete with

beautiful daughter. The increasingly prolific Scott Adams is still with us, this month he discusses Exatron Stringy Floppy in conjunction with his Adventures. Lance Micklus gives

his viewpoint on the home computer front and the infamous SoftSide Continuing Data Base does just that: continues. So do we. 'Til next month, a merry munchkin farewell!

OUTPUT 1

Dear Sirs,

As an Atari owner, I'm delighted with your new format. I am looking forward to a great range of program types. The almost line-by-line documentation is great, but might include more information about possible variations, or machine to machine translations.

The Maze Search on page 48 is a wonderful game! There is one correction necessary in the program. As it stands, the computer goes into attract mode (rotating the colors in each register) after you have been playing for about nine minutes. This is quite distracting, and since the game is such a hit with the whole family, this would happen each game session. To correct that program, change line 1 to read:

```
1 POKE 77,0: GOTO 100
```

The POKE resets the attract mode clock to 0 each new maze, so nine minutes cannot go by on that clock.

On our TV set, we preferred changing the SETCOLORs in line 320 to SETCOLOR 0,1,8 and SETCOLOR 4,4,6. It is more fun to watch the maze being drawn without the distractions of flashing random colors. Also, we changed the SETCOLORs in lines 410, 420, and 430 to SETCOLOR 0,1,8 - SETCOLOR 2,0,0 - and SETCOLOR 1,12,10 - all for greater cursor and target visibility (at least, on our TV set).

Has anyone come up with a two-person variation of Maze Search? I've tried with no success so far. Both players would play at the same time on the same maze, either competitively or cooperatively.

Again, congratulations on your magazine. I can hardly wait for the next issue.

Yours truly,
Bruce Frumker
Cleveland Heights, Ohio

Dear **SoftSide** staff,

I am 14 years old and the co-user of an ALTAIR 8800 computer (my Dad and I fight over it!). I am an avid reader of the TRS-80 version of **SoftSide**. I enjoy trying to convert the TRS-80 games to

ALTAIR BASIC. TRS-80 BASIC has many neat commands and it's a real challenge to figure out what they do and find a way to do the same thing or close to it in ALTAIR BASIC. The only things I can't decipher are the graphics codes. I bought the LEVEL II BASIC book, hoping that it would help me. It did, to a point. Now I can decode the "control codes," but to see the "graphics codes" I was instructed to run a simple program. If I could display the codes I wouldn't need to decode them! Now I bang my head against the wall every time I see a program with TRS-80 graphics.

But you guys came through again! In the August '80 issue your article "Converting Graphics" gave me the insight I needed. I just want to say, "Thanks and keep up the good work!" All you need to do now is print some programs in ALTAIR BASIC.

Sincerely,
Barbie King
Bellevue, WA

Dear Sirs:

I was very happy to receive my sample copy of the new **SoftSide**. This is certainly a great idea. Those of us who are not as knowledgeable as your marvelous editorial staff will benefit greatly from learning all about the wonderful Atari Computer that can function without a CRT of any kind. The chart on page 58 was most helpful. As soon as I figure out how to hook up my TRS-80 to the color TV that you list as essential equipment, I'm going to get one of those Atari 400s. By the way, how do you know what the computer is doing without the use of a screen?

Sincerely,
James W. Chapman
Diamond Bar, CA

Near's we can figure it, either the Atari is wired for direct connection to the brain or the color TV set belongs to the Atari.

GWB

Gentlemen:

I want to congratulate you on your article DEVELOPING DATA BASE, PART I, by Mark

Pelczarski. This was exactly the type of programming I needed to put the computer to work for me. In my business we need a lot of historical trend data and your program came at a perfect time. My son and I were ready to go on the outside and get the software written, but thanks to you we have finished one of our required programs and feel confident that we can accomplish the other objectives.

I estimate that I've already paid for my next several years of subscriptions on this one article.

Keep up the good work and our hats are tipped to Mark.

Yours truly,
Ron Walser
Roslyn Heights, NY

Dear Mr. Garon:

I have been using the Microsoft Basic Compiler recently, and I came across a useful bit of information that you may wish to share with your readers.

I use the RS-232 serial port to drive my Centronics 761 printer, and naturally I need to use my own serial printer driver program to link in with the printer DCB. I wrote a Basic program using LPRINT statements, compiled it, (linked it), then loaded my driver and executed the compiled /CMD file. I crossed my fingers when it came to the LPRINT statement, but instead of print-out, the dreaded "silent death" syndrome appeared.

I figured that one of two things was happening:

- a. The compiler was not using the TRS-80 printer DCB, and going straight to 37E8H, the parallel port.
- b. My serial driver routine was getting clobbered, causing the machine to go West when it tried to execute it.

Faced with this dilemma, I decided that I should write a short BASIC program:

```
10 LPRINT "HELLO"  
20 END
```

compile & link it, and disassemble the object code. It should be

obvious what the compiled code was doing, right? Eeegads!! The /CMD file produced by this program was NINE GRANS! This called for serious measures. Apparat's DISASSEM to the rescue!

Using the cross reference table feature of DISASSEM, I produced a listing which would get more rapidly to the place in the code that was doing the direct interface to the printer. Quickly scanning the cross listing revealed no reference to 37E8H, meaning that the compiled version was not going straight to the printer. Breathing a sigh of relief, I discovered that the ROM routine to write a character to the printer DCB should have been called with the character to print. I.e., my printer driver was called but it wasn't home. Something was clobbering it!

A little more advanced hackery was needed here. I re-linked my test program, this time telling L80 to put the code it produced up out of DOS' way (-P:7000 command to L80 told it to put the code at 7000H). Now, I could load the code in memory using TRSDOS' LOAD command, and look it over with RSM.

I traced the initialization code, and it only took a few JMPs to find what I was after. The compiled code grabs its value for MEMORY SIZE from location 4049H (16 bits, standard Z-80 order with low order byte first) which is set up by DOS. It then sets the Z-80 stack pointer to this location. My printer driver, which resides at the end of memory, was getting eaten up by the stack! The solution was simple. I added the following to my printer driver code:

```
ORG 4049H ; DOS memory size
           value
DEFWINIT-1 ; Stuff it with the
           address
           ; of the last byte prior
           ; to the code you
           ; want to
           ; protect
ORG 0FF00H ; Start of printer
           driver
```

INIT. . .printer driver starts here. . .
I load my printer driver in the usual manner (it performs some initialization, so it is a /CMD file. . .I just type its name, PRINTER, from DOS READY), and then execute the compiled BASIC code by typing the name of the BASIC object code (/CMD) file.

The BASIC object code picks up the value for memory size put there by my printer driver, and starts the Z-80 stack right before the driver code. Now I can print with compiled code.

Naturally this technique would work with any other machine language program you wanted to protect from BASIC. This will be very useful to those people who purchase the BASIC compiler but not the Microsoft Macro Assembler. If you have the Macro Assembler, you can link your machine language routines right in with your BASIC code when running L80, and then there is no need to protect memory and load them separately.

Before I close this out, let me mention that I have not found the BASIC compiler's error recovery to be the world's greatest!

Example: when compiling this program:

```
10 PRINT "THIS LINE IS
ENDED BY A DOWN ARROW
AND THE TEXT CONTINUES
ON THE NEXT LINE"
```

the machine goes into DEBUG! Some programs get every error flagged beautifully, but others just cause the machine to go out to lunch, no reboot or anything. How software like this makes it out the door is beyond my wisdom.

I have found that a startling improvement is possible on sorting arrays of integers. An array sort using Shell-Metzner went from 45 seconds interpretively to under a second compiled!

Although I notice that Radio Shack is stating that the compiler is not compatible with Disk Basic (I assume Radio Shack will be selling Microsoft's compiler), I have had no trouble getting things compiled. Bohlke's Golf game from the last SoftSide really speeds up, in fact there really should be some delay loops added!! Another BIG improvement was Scott Adams' Backgammon from a few issues back. Interpretively, it was a bit too slow to hold my interest. Now it almost moves instantly, sometimes taking 3 or 4 seconds.

1. Remove CLEAR statements that reserve string space.
2. Add DIM statements that were omitted, using the default array dimensioning feature of the interpreter.
3. The "THEN" in IF. . . THEN cannot successfully be

replaced by a comma, (one of Bohlke's favorites) and in many cases where it can be omitted in the interpretive code it is required for the compiler.

4. FOR. . .NEXT loops should be strictly nested. The interpreter is very loose about this, but the compiler is strict. You must have only one NEXT statement for each FOR. You can easily patch existing code with multiple NEXTs per FOR by substituting a GOTO line number containing the NEXT for the multiple NEXTs, e.g.

```
10 FOR I = 1 TO 20: IF X(I) = 0
   THEN NEXT I
20 X(I) = X(I + 1)
30 NEXT I
```

should be changed to:

```
10 FOR I = 1 TO 20:
   IF X(I) = 0 THEN 30
20 X(I) = X(I + 1)
30 NEXT I
```

If you follow these conventions and you are lucky, the compiler will produce a nice fast (although somewhat bloated) version of your program. Since the object files are quite large, I suggest using the compiler sparingly, only when the speed up is really required.

Sincerely,

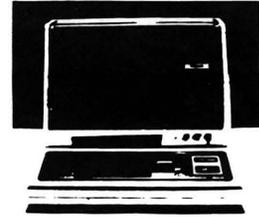

Rowland Archer, Jr.
Hillsborough, N.C

Gentlemen:

What irony — "Speed on the TRS-80" on one page and "Opposite Graphics Relationships" on the next (The S-80, September, 1980). I don't consider myself a "pro" — I'm a 15-year old, and a sophomore, although I've had nearly a year of on-keyboard experience, in both BASIC and Z-80 assembly language. Yet I must say, I made a total mockery of the inverting program in less than ten minutes at the keyboard. Eliminating the top-to-bottom inverting section (lines 90-200), your program takes 41 seconds to execute, and occupies 259 bytes of memory. My version takes 27 seconds to execute, and with three program lines it occupies only 118 bytes of memory. Here's how it goes:

MICROSOFT

BASIC COMPILER

Bringing BASIC Up To Speed

You have all kinds of good reasons to program in BASIC. BASIC came with your TRS-80. It was easy to learn, it's easy to use, and it's powerful enough for a wide variety of applications. But face it, you didn't choose BASIC because it was fast. Until now, if you wanted fast execution time you had to go to a whole new language.

Now you can get fast program execution times and more without giving up BASIC. Microsoft BASIC Compiler is a powerful tool for BASIC programming that makes programs run an average of 3-10 times faster than programs written in Disk BASIC.

How It Works

Microsoft BASIC Compiler can manage those incredible speeds because it's a compiler, instead of an interpreter. (Level II, Disk BASIC and other microcomputer BASICs are interpreters.)

The compiler produces highly optimized, Z-80 machine code that is directly executed by your TRS-80. Disk BASIC, on the other hand, has to scan each line of the source program every time the program is run.

You simply type in and debug your program as usual, using your BASIC interpreter. Then you enter a single command line, telling the compiler what to compile and what options to use.

BASIC Compiler takes it from there, producing optimized machine code as a relocatable binary file. This file, called the object program, is then loaded and linked with BASIC's runtime library using a utility program called LINK-80. Both the runtime library and LINK-80 are included in the BASIC Compiler package.

When you run your compiled program, you'll be amazed at the difference! The increase will vary, depending on the program, but can be **as much as 30 times** the execution speed of your interpreted program if you make maximum use of integer operations.

And you can save your compiled program on disk so you don't have to recompile it every time.

More Than Speed

As if speed weren't enough, Microsoft BASIC Compiler also adds features to the already powerful Disk BASIC to make your programming easier. It incorporates many of the features added to the Microsoft BASIC interpreter in the fifth major release, including:

- * WHILE/WEND Statement. A new conditional statement that gives BASIC a more structured flavor.
 - * CALL Statement. Lets you call assembly language and FORTRAN subroutines much more easily than in Level II.
 - * Long variable names. Up to 40-character variable names are allowed and they may contain embedded reserved words.
 - * Double precision transcendental functions. SIN, COS, TAN, ATN, LOG, EXP, SQR are supported as an exclusive feature of BASIC Compiler.
- Powerful BASIC language features you can use within Disk BASIC include:
- * PRINT USING for formatted output. Includes asterisk fill, floating dollar sign, scientific notation, trailing sign and comma insertion.
 - * Four variable types: Integer, String, Single Precision Floating Point (7-digits) and Double Precision Floating Point (16-digits)
 - * Trace facilities (TRON/TROFF)
 - * Error trapping
 - * Direct access to CPU I/O ports with INP and OUT
 - * Read or write any memory location using PEEK/POKE
 - * Matrices with up to 60 dimensions
 - * Nested IF/THEN/ELSE
 - * Boolean operators OR, AND, NOT, XOR, EQV, IMP
 - * Complete file manipulation statements: OPEN, CLOSE, GET, PUT, KILL, NAME

The Inside Story

It's the optimization processes that take place while a program is being compiled that make programs run under BASIC Compiler compact and incredibly fast. The optimizations occur:

- * Expressions are reordered to minimize temporary storage and to transform floating point division into multiplication wherever possible.
- * Constants are folded wherever possible.
- * Constant multiplications are distributed to allow more complete constant folding.
- * Peephole optimizations are performed, including strength reduction.
- * The code generator is template-driven, allowing sequences to be generated for the most commonly used operations.
- * String operations and garbage collection are extremely fast.

System Requirements

BASIC Compiler will operate on a Radio Shack Model I TRS-80 with one disk and 48K RAM. Programs compiled with the BASIC Compiler may be stored on disk. **\$195.00 plus \$3.00**

FLOPPY DISK DIAGNOSTIC

by Dave Stambaugh

Now includes memory diagnostic at the same price

The best and most complete diagnostic you can buy to verify disk drive reliability and find problems. Displays 19 error messages and cross references them to 14 possible causes. Continuous test option for exhaustive testing keeps statistical record of all errors found.

- 35 or 40 track in same program
- Tests controller functions and status bits
- Tests drive speed and allows adjustment
- Tests switches and mechanical components
- Verifies data transfer
- Tests drive seek function
- Sector and byte write and read tests using all possible patterns
- 16 to 48K, 1 to 4 disk drives
- Tests cross cylinder interference
- Tests drive-to-drive compatibility

Supplied on diskette with manual for only \$24.95.

TOLL-FREE ORDERS:
1-800-258-1790

(in NH call 673-5144)

by Lance Micklus

Remember the editorial section of **Prog 80**? Well this is it. I've decided to rename it **MY SIDE OF THE PAGE**, so as not to confuse it with the regular monthly editorial here in **SoftSide**. This column will appear every other month, time and space permitting (my time and **SoftSide's** space). So, here we go. . . .

Since winter is on the way and a lot of new products are coming out, this might be a good time to comment on what the future looks like.

The TRS-80 Model III is certainly going to be a winner if they ever get the operating system straightened out. Although it is priced slightly higher than a Model I, it is still cheaper than the original Model I was back at the beginning. The Model III is definitely going to be the hottest selling machine for at least the next couple of years.

The TRS-80 Model II is going to do better this year than it did last year when it first came out. Slowly, the software is appearing on the market to support it. The unit number of sales will, of course, be much lower for the Model II than the Model III or even the Model I. But, in its own right, it will do quite well.

The Model I is doomed thanks to the F.C.C. regulations. Still, there are a lot of Model Is out there in good working condition. I have yet to see one that has worn out. The compatibility of the Model III to the Model I will also help keep the original TRS-80 alive for a long time to come.

The machine that everybody thought would be called the TRS-90 is being called the TRS-80 COLOR. Atari and Texas Instruments tried to enter this market with similar machines and failed. In my judgement, so will Radio Shack. In fact, compared to Atari, Radio Shack is at the disadvantage. Atari has years of experience writing super games. Radio Shack does not. Let's face it, video gaming is Atari's market

MY SIDE OF THE PAGE

and even they have not been able to pull much of a profit out of their top-of-the-line home game machines. Add to that the fact that money is very tight right now, and you're going to see a lot of slow sales in the consumer video market in general - which includes TV projectors, video recorders, and such.

The problem with the Atari 400, Texas Instruments, TRS-80 COLOR, and other machines of this type is purpose. The people who are buying microcomputers want a practical machine - not a toy. In other words, they want a computer that can do useful things first, and play games second. Even the TRS-80 Model II proved that. My Model II GAMES Disk is selling extremely well and you've got to admit the Model II is not a game machine by any reasonable definition. The game computers are coming at this from the other direction. They come across as machines that play super games but can also do useful things. Somehow, that just doesn't wash.

The TRS-80 Pocket Computer is going to sell like gangbusters. It is a solution looking for a problem. It's one of those things that you know has got to be useful, and then you go and find reasons to justify its existence. Sadly, Radio Shack blew it with their tape storage format. The output appears to be RS-232 compatible but at an odd baud rate. A lot of people need a portable computer to collect data that can later be uploaded to a TRS-80. From there you can go anywhere. I have one client here in Vermont who is actually lugging around a TRS-80 Model I in the back of a station wagon, using batteries to run it. He uses it to record his field data about solar energy on tape. When he gets back to his office he transfers the tape to disk, and then uploads it to a PDP-11 using ST80-III. I've already talked to one hardware guy who thinks he can solve the Pocket Computer upload problem using a modified Micro-Connection, so I know it can be done. Once some kind of

practical solution to this data problem does come out, the TRS-80 Pocket Computer should break all sales records.

While the Apple has done well so far, the Apple and the Softcard will probably make all previous Apple sales look bad. A lot of software vendors have avoided Apple because their 8080/Z80 machine language code would have to be completely rewritten for the 6502 chip. Yet, many vendors don't mind modifying their machine language code to bring it up on another system. The Softcard now gives Apple access to either the 6502 or Z80 code and runs CP/M. It now will become feasible to modify Wordstar, Pencil, Microsoft compilers, and ST80s to run on the Apple. In some cases, no modifications will be needed at all. That's going to generate a lot of interest in software vendors who previously couldn't get into the Apple because of the 6502 chip.

The PET is an excellent machine in terms of units sold. But most of the sales are overseas, not here in the U.S. The PET is simply no match for the TRS-80 Model I & III. I don't see this situation changing. If anything, I see it getting worse. Both TSE and I seem to be getting more and more TRS-80 mail from the other side of the world. This indicates to me the fact that the TRS-80 is getting more and more notice than ever before, overseas, even without a Radio Shack store in every city. And that's bad for the PET.

Heathkit has got to get their act together. I don't know who's in charge over there, but they are not keeping up with the state of the art. This shows up in all kinds of ways, big and small. The other day, for instance, I noticed WH-14 printer manual gives the control codes in decimal, octal, and ASCII. Who uses octal anymore and what about hexadecimal? And then there is the disk drive on the All-In-One computer which is hard sector. The last time I saw a hard sector disk was on an RCA Video IV whose design goes back about 10 years. On the plus side for Heathkit is their excellent customer support. Gee, you can open the cover without voiding the warranty. That's really nice. Heathkit also has got the marketing place.

The Super Brain probably will be a poor seller. It needs the

marketing vehicle that Heathkit has. I guess that's like saying that if Heathkit made the Super Brain, it would sell a lot better. One bad omen with the Super Brain is the fact that it is a Z80 CP/M S-100 bus machine. Historically, that magic combination seems to have spelled failure.

The Sorcerer is another sad story. It's a machine that might have made it and didn't. Manufacturer support for the Sorcerer is sadly lacking and rumors abound of financial troubles over at Exidy. They certainly have had a lot of staff turnover during the last 18 months. When you look at the Sorcerer, you see that same curse: Z80 CP/M S-100 bus.

Computer software is also undergoing changes. About 18 months ago, the market was swinging toward low-priced items. Although it seemed to make sense at the time, it was really a stupid idea. People who don't have money don't buy their own personal computer. Computer users do have money. What they want is value which does not necessarily mean low cost. Now, you're going to see slightly less software, higher prices, but better quality, superior packaging, and improved customer support. One good program will always be worth more than five poor ones. This is going to create a void, however, for the small selling low-priced items. I've seen a lot of programs which are good but will only sell in small numbers and at low prices. The problem is going to be how to keep these products on the market. I'm thinking especially of computer games. I predict that something will come up to fill this need but I don't know for sure what that will be.

Over on the hardware side, you're going to see two battles. The first is the modem war. This is not going to be so much of a price war as a performance war. In other words, the price of modems will remain the same, but the features will keep getting better and better. The other war will be in the area of printers. The trend is going to be toward a smaller dot matrix (more dots) and bidirectional printing at faster speeds. Yet the price will keep coming down.

The cost of disk storage, too, will keep coming down while performance will continue to

increase. But the ultimate direction in disk storage will be shared file access. The problem with shared file access is in the design problems for a bus structure and an operating system to support it.

Digital Research has found a neat way around both of these problems with a new operating system call CP/NET. CP/NET uses a host computer that is well equipped with hardware, especially disk storage. Microcomputers are connected to the host via RS-232 lines. These micros run a special CP/M operating system that automatically sends and receives data with the host using a special protocol. To the microcomputer, the host computer will appear as if it were a disk drive or a printer. This lets several users share the host and its equipment while each user operates with his own CPU and memory.

Still, multi-task multi-user systems are going to be the most conventional way of sharing data files for at least the next couple of years. These are turning out to be mini-computers that use microcomputer chips - usually the Z80 - and memory bank switching. MP/M is one operating system designed to do exactly that. The new 16 bit CPU chips, such as the Z8000, will also create more interest in what is really time-sharing on a small scale.

Rumor has it that Radio Shack is working on such a machine right now. This is supposedly the TRS-80 Model IV. It looks like it will use the Z8000 for a CPU chip. If the rumor is true. I believe the machine will be announced next summer and go into production next fall.

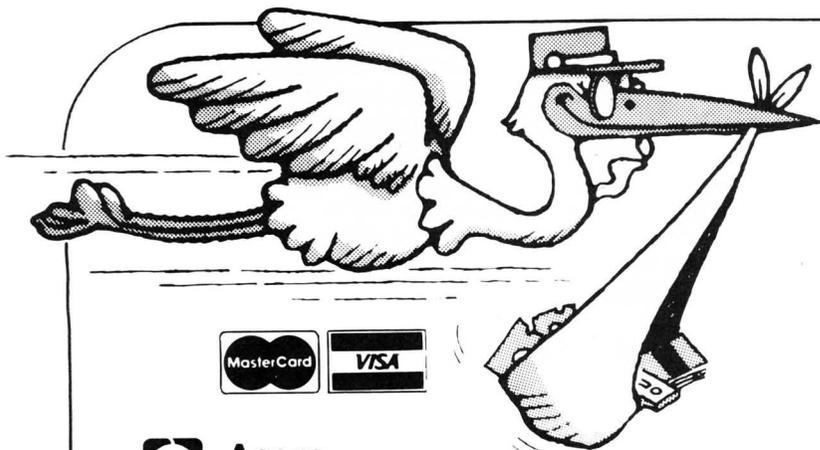

Overall, I think the microcomputer market is going to continue to be very healthy. The biggest problem, I think, is going to be for vendors and users to keep up with all of the new products. Yet, in spite of all of the confusion, someday people will refer to the next few years as the golden era of the computer.

SUPERSCRIPT

by Richard P. Wilkes

SUPERSCRIPT is a series of Machine Language programs which permanently customize Scripsit™ for the following:

- * The user can now get a DIRECTORY from within SuperScript which lists all files and the number of free grants on the diskette.

- * Files can be KILLED from within SuperScript using the 'K' command. This is invaluable when extra space is needed to save a large text file.

- * The KEYBOARD DRIVER is changed to allow a correct key repeat which is faster than tapping on a key and which does not destroy the video display.

- * Operator may INSERT TEXT into un-justified lines during printout. For example, inserting a name after "Dear" and before the colon.

- * Parallel and serial drivers are included on the disk.

- * Serial drivers are included which use the ETX/ACK protocol for 1200 baud communications.

- * On printers that can backspace, UNDERLINING and SLASHED ZEROS are options.

- * On Diablo and NEC printers, one can SUPERScript, SUBSCRIPT, UNDERLINE, BOLDFACE, SLASH ZEROS, and select 10/12 pitch.

- * User can CUSTOMIZE the serial and parallel drivers for use with other types of letter-quality printers.

- * The initial character sent to the printer is changed from a linefeed to a carriage return to empty buffer.

- * The "L" command used to load a file now requires a filespec to avoid destroying text buffer if the question mark is omitted from the "?L" command.

- * A REQUIRED SPACE may be specified when it is undesirable for SuperScript to place spaces between parts of the text when justifying.

- * SPECIAL CHARACTERS such as brackets, braces, and carets can now be entered from the keyboard.

- * Status messages at the bottom of the screen are more terse and are in upper and lower case.

- * SuperScript protects drivers in high memory.

- * A relocating LOWER CASE driver is included for use when utilizing the text insert function. Instructions can be obtained from the source code provided on its use in BASIC.

TRS-80 Level II, 32K disk \$29.95

CONCENTRATION

Select a square and reveal one half of a fabulous prize! Find the other half and it's yours (well, not really). Stereos,

televisions, Disneyland trips... they're all on the big screen. There's even a TRS-80!

But don't forget the basic rules! Concentrate on what's on the board, or you'll end up helping your opponent more than yourself.

TRS-80 Cassette \$7.95

STATPAL

by Bruce Chalmers

Stumped by statistics? Here's the program for you!

Written by a statistician but designed for use in the real world. Helps you: Create files, examine and edit data, and understand descriptive statistics. Sophisticated enough for the working statistician. This powerful interactive statistical package features: Complete error diagnostics, missing value specification and sophisticated graphics.

TRS-80 Disk 32K & 48K versions on one disk \$29.95

OPTIONS MONITOR

by W. J. Kutluer

THE INVESTOR'S KEY TO OPTIONS MARKETING!!

Make informed trading decisions in minutes with this easy to use package.

WHO: Investors, Option Writers or Purchasers use this program.

WHAT: Analyzes option prices and responds to current market prices as soon as you receive them.

WHY: Assesses the value of a given option. Monitors the value of your investments. Helps you decide when to purchase or to close out your options.

HOW: Use TRS-80 Disk.

Next to your broker - this program is your best option in creative investing. Analyze option prices before risking any money. Convenient features are data entry and flexibility in handling a wide variety of situations.

Available for Level II, 16K TRS-8 Microcomputers \$29.95

SCREEN MACHINE

Open the manual and LOAD the cassette. Then get ready to explore the world of programmable characters with the SCREEN MACHINE*. You can now create new character sets - foreign alphabets, electronic symbols, and even Hi-Res playing cards, or use the standard upper and lower case ASCII character set.

The SCREEN MACHINE lets you redefine any keyboard character. Create any symbol by using a few easy key strokes and the SCREEN MACHINE will assign that symbol to the key

of your choice. For example: Create a symbol, an upside down "A," and assign it to the keyboard 'A' key. Now every time you press the 'A' key, or when the Apple prints an 'A', it will appear upside down. Any shape can be assigned to any key.

The SCREEN MACHINE gives you the option of saving your character symbols to disk or tape for later use. There is no complicated 'patching' needed. The SCREEN MACHINE is transparent to your programs. Just print the new character with a BASIC print statement. The SCREEN MACHINE is very easy to use.

Included on the cassette are Apple Hi-Res routines in SOF-TAPE prefix format. You can use both Apple's routines and the SCREEN MACHINE to create microcomputing's best graphics.

Cassette and Documentation \$19.95
Disk version \$29.95

SOFT MUSIC

by Steve Bjork and Patricia Cartier

SOFT MUSIC is a two-voice, seven octave music synthesizing program. Although it is written in Machine Language, it appears as a BASIC line. By this method it is possible to save and load Machine and BASIC Language programs together.

With a general knowledge of music, you will be writing songs and adding to your BASIC programs in no time.

Also included in this package is a MUSIC EDITOR to aid in the development of songs for SOFT MUSIC.

TRS-80 16K Level II, Cassette \$24.95

FORTH II

FORTH II is an extremely well-documented version of the Forth language that has been in use since the late 1960s.

It is many times faster than BASIC and is easy to use. Some of its features are:

- *Runs on any Apple II computer (24K minimum);
 - *Supports DOS 3.2;
 - *Control C Break and Continue;
 - *Compatible with Autostart ROM;
 - *"Save it" file for customizing system;
 - *Disk-based editor and compiler
 - *Complete instructional reference manual;
 - *Excellent execution speed and memory efficiency;
 - *Verbs for graphics, game I/O, sound, disk and tape I/O.
- \$49.95

HELLFIRE WARRIOR

At last, the sequel to the "Temple of Apshai." Dunjon-quest's newest, "Hellfire Warrior," adds four more levels to the lowest reaches of Apshai's dunjon. Undead and fiery demons roam seemingly endless labyrinths, gobbling up all but the hardiest warriors. If you are a beginner, perhaps you should explore other regions first, for "Hellfire Warrior" is for only the most hardened.

Cassette \$24.95
Disk \$29.95

Brøderbund Software

THE GALACTIC TRILOGY

These first three games in the Galactic Saga put you in the commander's seat with complete graphics giving you all the information you need.

1. GALACTIC EMPIRE

The Problem - unite the galaxy of 20 worlds under a single flag, starting from a single world neither large nor powerful. The Challenge - time and distance are real; if you don't get troops and material to the right place at the proper time, they will do you no good. The Solution - scouting, planning, a head for logistics and picking your targets are the ingredients for your success.

2. GALACTIC TRADER

Relieved of your command in peacetime, you are forced to become a trader to survive. Use your bartering ability and knowledge of the galaxy to outwit the sharpest business creatures in the galaxy. Ten levels of difficulty so you never outgrow the game.

3. GALACTIC REVOLUTION

Pit your skill at manipulation against the Emperor as you compete for the allegiance of the various power groups whose help you need to wage the Galactic Revolution! For one to three players.

Soft Sector Marketing, Inc.

BOSS™ 1980 UTILITY REFERENCE MANUAL

by V. B. Hester

Version 2.1

The BOSS is designed to aid you in creating and debugging programs written in BASIC. It will allow you to trace the program flow, to single step the BASIC program, to observe the conditions of variables during program execution, and to push your BASIC programs on the stack or pop them off the stack during program development. The BOSS operates with: TRSDOS 2.2-2.3, NEWDOS 80, NEWDOS 2.1, and VTOS - 3.0.

The BOSS will operate with either Level II BASIC or Disk BASIC. Minimum equipment configuration is 16K Level II TRS-80 with cassette input. Functions include:

* TRACE FUNCTION - Allows you to follow the twisted (or logical) path your program takes, without messiness on the screen caused by the other trace function.

* SINGLE STEPPING - Allows you to single step individual lines of a BASIC program of individual instructions within a line.

* BREAK POINT - The trace and single step commands can be invoked by your program while it is running with this feature.

* REVIEWING VARIABLES - Allows you to pause to review selected variables during program execution and return to your program with the display restored to that shown before you review the variables (great if your screen had graphics displayed).

* STACKING PROGRAMS - Allows you to stack one or more programs in high memory while you work on or run another program. Of course, this ability is limited by the amount of free memory space available. You can retrieve the stacked programs at will.

THE MIND APPLIANCE: HOME COMPUTER APPLICATIONS

by T.G. Lewis
(Hayden)

Chock full of unique and challenging ideas for applying your computer to home use. Make your computer write poetry, balance a checkbook, dial a telephone automatically, handle household budgets, menu planning, shopping lists, and income tax calculations. Dozens of BASIC language programs, including: Buying for the Home; The Garage (Fundamentals of BASIC); The Living Room (Simple Retrieval); The Kitchen (Advanced Retrieval Systems); The Bedroom (Word/Text Processing); The Den (Business Processing); The Bathroom (Graphics); The Split Level Home (Ideas); and a Glossary.

\$9.55 plus \$1

CP/M SOFTWARE SUMMARY GUIDE

(Rainbow Associates)

Rainbow Associates announces the CP/M Software Summary Guide — a concise, handy summary of the major software used on most CP/M systems. Included are summaries of the CP/M operation system, Microsoft BASIC, CBASIC™, and the CP/M utilities DESPOOL™, MAC™, and TEX.

The CP/M summary covers the commands (DIR, ERA, REN, SAVE, TYPE, USER) and utilities (ASM, DDT, DUMP, ED, LOAD, MOVCPM, PIP, STAT, SUBMIT, SYSGEN, XSUB). Each one is explained briefly and clearly with examples. The booklet also summarizes all features of Microsoft's BASIC-80 (including the compiler) and Compiler System's CBASIC. Error codes for CBASIC-1, CBASIC-2, and BASIC-E are also summarized in a single alphabetical list. Examples and definitions clearly explain the workings of DESPOOL, MAC, and TEX utilities offered by Digital Research.

The CP/M Software Summary Guide, 60 pages long, is designed to be especially easy to use. Features are organized alphabetically, so the reader can find an explanation quickly rather than having to page through various function sections. This solves the single most common complaint programmers have about manuals and summary guides.

About the size of a paperback book, the Guide is handy to hold. Indenting and capitalization are used to make the information "jump out" at the reader. "The idea for this booklet is attributed to need; the format is attributed to common sense," says Bruce A. Brigham, Rainbow's Technical Consultant and author of the Guide. \$3.75 plus \$1

TEN EASY PIECES: CREATIVE PROGRAMMING FOR FUN AND PROFIT

by H. Sagan and C. Meyer,
(Hayden)

An introduction to the BASIC language through computer games. Written in an informal style, it stimulates interest in creative programming of games of chance and of skill. Teaching by example, these games illustrate the various programming techniques at stages of difficulty which are suitable to almost unlimited modification, simplification, or amplification. Emphasis is on prompting creativity on the part of the reader. The text requires little knowledge of elementary mathematics.

\$7.95 plus \$1

UNDERSTANDING MICROCOMPUTERS

(Scelbi)

Here are the answers to hundreds of questions about microcomputers. Written in simple English. You get the fundamental concepts behind the operation of virtually all microcomputers. Convenient glossary covers all the key words.

Introduces BASIC language programming. Tells how to select a small computer system. Basic instructions for almost every class of microprocessor are illustrated along with details on how a CPU is organized and how it follows directives and solves problems. Explains flow charts, program worksheets and memory maps.

\$9.95 plus \$1

VINYL BINDERS

Quality vinyl binders with 12 metal rods, perfect for storing your back issues of **SoftSide**. \$4.95 +\$1

STIMULATING SIMULATIONS, 2nd Edition

by C. W. Engel
(Hayden)

An exciting handbook containing twelve "simulation programs," which are actually game programs. They include: Art Auction, Monster Chase, Lost Treasure, Gone Fishing, Space Flight, Starship Alpha, Forest Fire, Nautical Navigation, Business Management, Rare Birds, Diamond Thief, and The Devil's Dungeon. Clearly written in a BASIC format that is compatible with all microcomputers, they are all original and well-documented. Each program is presented with a listing, sample run, instruction, and program documentation, including flow chart and ideas for variations.

\$5.50 plus \$1

A CONSUMER'S GUIDE TO PERSONAL COMPUTING AND MICROCOMPUTERS

by S. Freiberger and P. Chew Jr.
(Hayden)

Both an introduction to the principals of microcomputers that assumes no previous knowledge on the reader's part, and a review of 64 microcomputer products from over 50 manufacturers. Other features include: extensive illustrations to reinforce the discussions, a selection and sources section to assist in reviewing, selecting, and purchasing microcomputer products; summary charts of major microcomputer products offering a quick summary of specifications for a given product, and comment sections covering the advantages, disadvantages, and best-buy tips for each microcomputer product.

\$8.95 plus \$1

STRUCTURED BASIC AND BEYOND

W. Amsbury
(Computer Science Press)

The BASIC programming language is presented in an easily understood and well written manner oriented toward interactive terminal use. The author emphasizes structured programming concepts and goes beyond to include concepts related to data structures, files, strings, and lists, stacks, and queues. Dr. Amsbury's treatment of the logical structure of programs is unique at this level. This text presents probably the most comprehensive and useful set of examples and exercises in BASIC. These range from simple to challenging; answers are provided to selected self-review exercises. These features make this book ideal for both teacher and student.
\$10.95 plus \$1

CHESSE AND COMPUTERS

D. Levy
(Computer Science Press)

This is the first really comprehensive book on the subject of Computer Chess. The first chapter describes the earliest chess "machine," the famous Automaton chess player that toured Europe and America, and there is a detailed account of Torres y Quevedo's invention that played the ending of king and rook against king. Following this is a lucid description of how computers play chess and then a detailed history of computer chess, including an account of early Soviet attempts at chess programming that contains much information hitherto unpublished outside the Soviet Union. David Levy's fascinating book continues with a record of computer chess tournaments and concludes with a description of various research projects that are currently under way and a prediction of what the future holds for chess programmers.
\$9.95 plus \$1

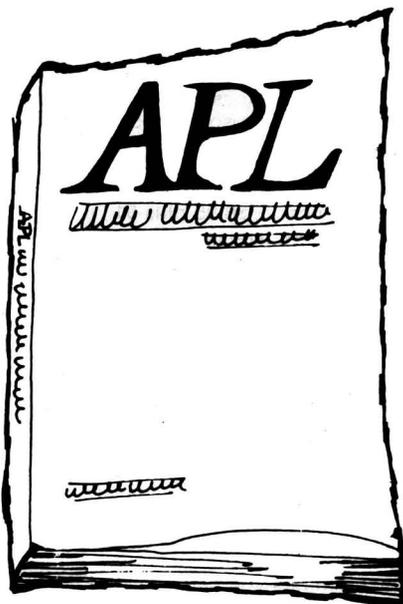

PASCAL

W. Findlay and D. Watt
(Computer Science Press)

The primary aim of this book is to teach good programming practice based on Pascal, the lingua franca of computer science. Its secondary purpose is to serve as an introduction to the language, for both the novice in computer science and the reader who has already learned one of the other computer languages.

By emphasizing sound programming principles, good style and a methodical approach to program development, the authors teach clear and logical expression that can be universally applied. No prior acquaintance with computers or with advanced mathematics is assumed.

A wide variety of examples, and graded end-of-chapter exercises, some with answers, have been included to reinforce the readers' comprehension of the text.
\$12.95 plus \$1

BACKGROUND MATH FOR A COMPUTER WORLD, 2nd Edition

R. Ashley
(Wiley & Sons)

In today's increasingly complex world of computers, this newly updated popular self-instructional guide will prove more useful than ever. In a sequential, crystal-clear format, it provides the basic mathematical facts, techniques, and ideas a person must understand to be effective in the computer world - the fundamentals for knowledgeable computer use by general consumers, professionals, and students in business, psychology, education, the humanities, and the social sciences.

Featuring an entirely new chapter on trigonometry this new edition helps readers work with computers in a far more meaningful, productive, and satisfying way. Its solid-math background equips readers to keep abreast of modern computer developments and relate these advances to their own profession.

This self-instructional guide requires only a minimal high school math background - and no prior knowledge of computers. Best of all, you can apply what you learn - with any of the computer languages - on a home computer, a small operation, or a major computer installation.
\$7.95 plus \$1

LEARN MICRO-COMPUTERS

(Scelbi)
A new multimedia information package. Includes text ("Understanding Microcomputers") plus high-quality cassette. For the beginner just starting in microcomputers. Covers all the basics quickly, easily and enjoyably. Companion tape includes chapter-by-chapter synopsis of the book. Great new idea for self-study.
\$14.95 plus \$1

BASIC FOR HOME COMPUTERS

B. Albrecht, L. Finkel and J. Brown
(Wiley & Sons)

Explains how to read, write and understand BASIC programs. This Guide includes applications and games for the hobbyist and others who want to put their computers to work or to play. "Gently leads the readers through the fundamentals of programming . . . Should be of considerable value to the apprehensive neophyte." — Datamation
\$7.95 plus \$1

THE BASIC HANDBOOK

by Dr. David Lien
(CompuSoft)

This book is unique. It is not a textbook. It's far more than a dictionary. It is a virtual ENCYCLOPEDIA of the BASIC language.

While not favoring one computer over another, it explains over 250 BASIC words, how to use them, and alternate strategies. Since over 50 computers are represented, yours is probably in here too. \$14.95 plus \$1

INTRODUCTION TO LOW RESOLUTION GRAPHICS

N. Wadsworth
(Scelbi)

Now you can produce amazing computer graphics graphics? You can't draw a straight line. Literally! Learn how to draw lines and shapes, make graphs, draw pictures and even do animation. The simple secrets of how to do all this are contained in SCELBI's new book "Introduction to Low Resolution Graphics."

Today's exciting personal and small business computing machines are generally provided with at least some kind of "low resolution" graphics capability. What is low resolution graphics? It is graphics presented on a point-by-point basis where the number of points is limited to about 8000 or less. The APPLE II by APPLE computers, Inc., The Radio Shack TRS-80 and the Commodore PET all have low resolution graphics capability. So do many other kinds of microcomputers.

What can you do with low resolution graphics? All kinds of things . . . If you know how! You can plot plain and simple or fancy and complex graphs to consolidate data, for business or pleasure purposes. But you can use the capabilities to improve the presentation and impact of almost anything you want your computer to tell people. It can be used to animate games or data, clarify and amplify educational materials, or just plain entertain people. \$11.95 plus \$1.

TAKE MY COMPUTER . . . PLEASE!

S. Ciarcia
(Scelbi)

An uproariously funny book about the true-life misadventures of author Steve Ciarcia and his computer's inability to cooperate. Hardcover.
\$5.95 plus \$1

TRS-80 BASIC

by B. Albrecht, D. Inman and R. Zamora
(Wiley & Sons)

Beginners rapidly learn how to program the versatile TRS-80 - today's fastest selling microprocessor - with this entertaining guide. The book's unique self-teaching format requires no previous familiarity with computers. Packed with exciting games and computer graphics, the book also includes learning activities in math and language art, and applications for home management, financial computations, and household record keeping. \$8.95 plus \$1

Z80 INSTRUCTION HANDBOOK

N. Wadsworth
(Scelbi)

Convenient pocket-size manual describes Z80 capabilities in easy-to-understand terms. Designed as a practical reference to mnemonics, machine codings, usage. For programmers of every level - beginner to professional - anyone working in Z80 machine or assembler language. Appendixed. \$5.95 plus \$1.

SARGON HANDBOOK

D. Spracklen, K. Spracklen
(Hayden)

Complete documentation covering all algorithms in Sargon can be found in this guide book. Contains complete table of contents, block diagram of the program, four part introduction, Z-80 listing, index to subroutines. Fully annotated. \$15.95 plus \$1

TRS-80 ASSEMBLY LANGUAGE PROGRAMMING

W. Barden Jr.
(Radio Shack)

Covers Z-80, and introduction to Assembly Language, the Radio Shack Editor/Assembler and T-Bug, and debugging methods; also explains how to move data, the use of arithmetic, compare, logic, and bit operators, shifts, strings, tables, input and output, and 12 commonly used subroutines. Well indexed and illustrated. \$3.95 plus \$1

Z-80 SOFTWARE GOURMET GUIDE AND COOKBOOK

N. Wadsworth
(Scelbi)

Over 100 usable subroutines, plus how to use them. \$15.95 plus \$1

TRS-80 DISK AND OTHER MYSTERIES

H. Pennington
(IJG)

The serious programmers' guide to Disk BASIC and the wonders of NEWDOS+. \$22.95 plus \$1

6502 SOFTWARE GOURMET GUIDE AND COOKBOOK

R. Findlay
(Scelbi)

Includes instruction set, floating point and decimal arithmetic, search and sort routines, and more. \$12.95 plus \$1

CALCULATING WITH BASIC

R Guido
(Scelbi)

Use your computer to calculate home mortgage payments, interest rates, payback periods and more. Complete routines already worked out for problem solving using BASIC language. Also includes mathematics, finance and statistics, mechanical engineering and electronics. \$8.95 plus \$1

PERSONAL INFORMATION MANAGEMENT SYSTEM

(Scelbi)

When you're in business you've got a personal stake in how information is managed. That's because information is your key to success. PIMS will allow you to unleash the power of a microcomputer - and you don't have to become a programmer first. Use a computer for accounts receivable . . . accounts payable . . . maintain inventory records . . . run a mailing list . . . keep track of credit charges. These are just a few of the many things you can do with PIMS. It is a ready-to-use data base management program for computers like the Commodore PET and Radio Shack TRS-80. You can define and construct your own data bases. Each record can contain up to ten fields. You can search, list and sort. There's even a command that let's you sum columns of numbers. PIMS provides a valuable introduction to data base management. Complete source listing. \$11.95 plus \$1

APL - AN INTERACTIVE APPROACH

L. Gilman, A. J. Rose
(Wiley and Sons)

This revised second edition of APL - An Interactive Approach has been renamed to reflect the fact that several versions of APL are currently being offered. In recognition of APL's growing use in business applications, more examples have been included, and the body of the text itself has undergone a modest shift in orientation toward commercial uses of APL.

Additional functions and features now available in both the IBM and Scientific Time Sharing implementations have been included in this edition, and the chapters on workspace management and function definition have been substantially rewritten providing additional graphic aids to the student. Where appropriate, sections have been included on distinctive features of the IBM 5100 Computer.

For this edition, nearly all the example functions in the text have been placed in a workspace named 1 CLASS. If your APL system lacks this workspace, it may be obtained from Scientific Time Sharing Corporation. \$16.95 plus \$3.

LITTLE BOOK OF BASIC STYLE

J. M. Nevison
(Addison-Wesley)

Ideal reference for BASIC programmer, junior high to research scientist. Indexed, illustrated, 151 pages. \$5.95 plus \$1

TRS-80 INTERFACING

J.A. Titus
(H.W. Sams & Co.)

What you need to know to connect your TRS-80 to the world. Assumes knowledge of some machine language programming. \$8.95 plus \$1.

PATHWAYS THROUGH THE ROM

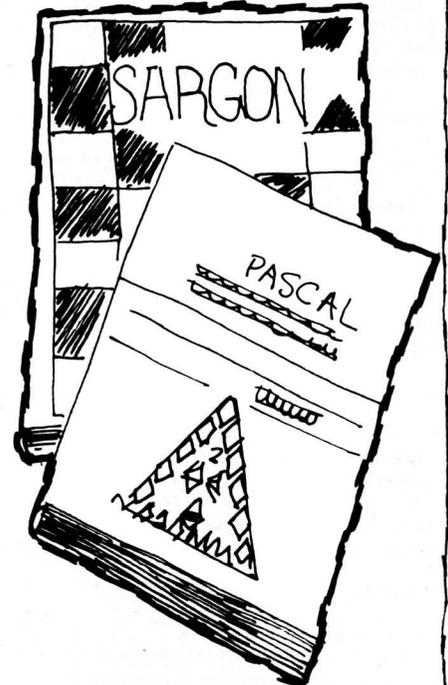

R.M. Richardson, R. Fuller, J.T. Phillip, G. Blank, J. Hartford
(SoftSide Publications)

The definitive guide to Level II BASIC. Includes Super Map by Fuller Software. The TRS-80 Disassembled Handbook by Robert Richardson, HexMem by J. Phillip, Z-80 Disassembler by George Blank and DOS Map by John Hartford. \$19.95 plus \$1

LEARNING LEVEL II

Dr. D.A. Lien
(CompuSoft)

The User's Guide to Radio Shack Level II BASIC. \$15.95 plus \$1

Z-80 AND 8080 ASSEMBLY LANGUAGE PROGRAMMING

K. Spracklen
(Hayden)

The best introduction to assembly language we sell. You should have experience in BASIC. \$7.95 plus \$1

THE SECRET GUIDE TO COMPUTERS

R. Walter
(Scelbi)

A quickie course on computers. \$5.95 plus \$1

MICROCOMPUTER POTPOURRI

(Scelbi)

A pocket-sized reference for the beginner. Has a really great glossary covering all the jargon. Full digest on understanding microcomputers. \$3.95 plus \$1

SAY YOHO

by Scott Adams

This month I will be taking a look at my new Odyssey series, plus I will be covering another way to map adventures.

At the time I developed my original adventure, disks were still just over the horizon and a TRS-80 16K Level I was still not an unusual sight. Thus my constraints were for a fairly complex game to be played in a machine with a limited amount of memory. This meant a reduction in vocabulary and also in textual output during the game, as well as commands having to be limited to one or two words at most.

Today, though, 90% of all Apple owners have disks and probably at least 50% of the TRS-80 owners do too! This gives me a medium to develop adventure-type games beyond my original 16K limitations, by using the additional 100K or so offered by the one-drive system. Adams' Odyssey will have some special additions to it. Some of these new features are:

- 1) More than one player in an Odyssey at one time. Players may help (or hinder) one another as they see fit!
- 2) Full paragraphs instead of "baby talk," e.g. "Shoe the horse with the horseshoe and the hammer and nails."
- 3) Longer messages;
- 4) Sound effects; and
- 5) expanded plot lines.

To develop this system I have actually had to develop a new type of computer language which I call OIL (Odyssey Interpretive Language) which is implemented by a special Odyssey assembler that generates Odyssey machine code. This machine code is then implemented on each different micro, e.g. Apple, TRS-80, etc., through a special host emulator to simulate my nonexistent Odyssey computer.

One possibility which I plan to explore further will be putting this host computer in FORTRAN and then running on a sharing system like MICRONET or SOURCE with maybe 100 players interacting in an Odyssey at the same time.

Currently (as of the Washington computer show, Sept., 1980) the

system is in the final stages of implementing a host emulator on a TRS-80 32K disk system and writing the first Odyssey (which has been sketched out and is tentatively entitled "Martian Odyssey") in OIL to run on the emulator. I hope that by the time you are reading this, Odyssey Number One will be available from your local computer store or favorite mail order house. Keep in mind, however, that this is but a hope and not a firm promise! In any case, once it does come out I hope it will be as much fun to play as it was to write.

Now a look at another way to map adventures.

Each room is represented by a box with the name of the room in it, and all original items found in it noted alongside. (See Figure 1).

"SIGN"

FIGURE 1

Directions from a location are indicated by a line coming out of ANYWHERE on the box, but with the direction leaving the box indicated by the first letter of that direction.

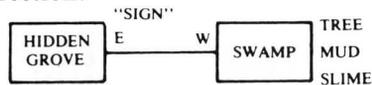

FIGURE 2

Figure 2 shows it is East from the grove to the swamp and West from the swamp to the grove. In the case of being able to go only in one direction, an arrow is put at the end of the path. (See Figure 3).

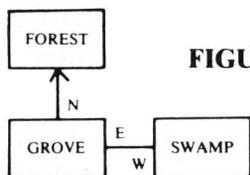

FIGURE 3

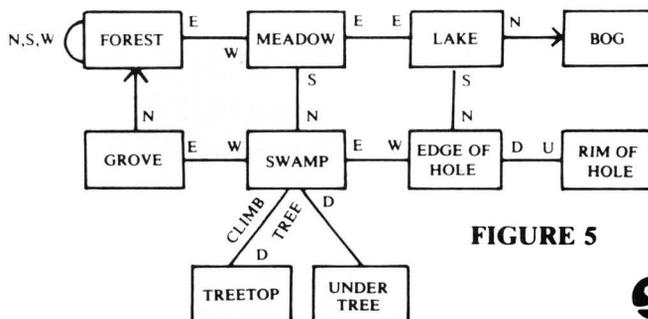

FIGURE 5

This indicates that upon leaving the grove you go north to the forest, but that you cannot return!

The best way to use this system is that, upon entering a location, you draw a line representing each possible exit and its direction. (See Figure 4). Later you connect them to rooms as you continue your exploration.

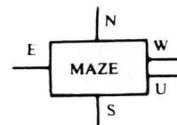

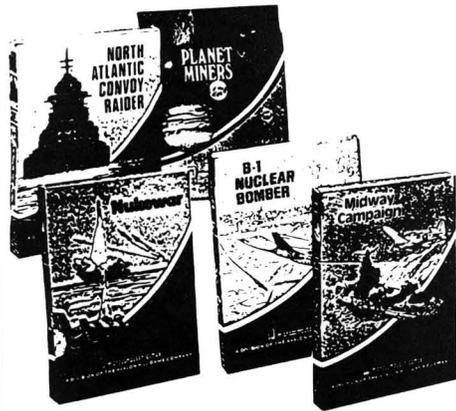

FIGURE 4

The advantage is that you will not forget to explore an exit once you get past your initial probe. Another advantage of this system is that you never need to redraw your map as you stick extra locations anywhere on your paper. (See Figure 5).

Also notice that on the forest the exits N, S, W are available, but that they all return to the forest! Note also that as additional locations were found off the swamp, the map was not redrawn. Instead, the locations were simply put where needed. And since we "climb tree" instead of going in a particular compass heading, we wrote that as directions to leave the swamp.

I hope you'll find this an easy system to use. You should find that once you start using it, you will spend less time mapping or wandering around lost than you may have in the past! (P.S.: Systems analysts may recognize this system as a modified HIPO Diagram used to indicate program flow and control.)

'Til next month, Happy adventuring!

NORTH ATLANTIC CONVOY RAIDERS (\$15)

This game is a computer simulation of the Bismarck convoy raid of 1941. The computer controls the British convoys and British battleships. Will the Bismarck sink the Hood, only to be sunk in turn by the Rodney and King George V, as in history? Or, will the Bismarck cripple or sink the British Home Fleet and go rampaging through the convoy lanes? Your decisions will determine the fate of the Bismarck.

This SOLITAIRE game includes software and instructions for the following computers: TRS-80* Level II, 16K Memory Apple II*, Applesoft* BASIC, 16K Memory beyond BASIC Pet*, 16K Memory

NUKEWAR (\$15)

NUKEWAR is a computer simulation of a nuclear confrontation between two hypothetical countries. You must choose the methods to defend your country: either by massive espionage efforts, or by building jet lighter-bombers, missiles, submarines, and anti-ballistic missiles. Meanwhile, your cold and calculating computer will choose its own strategy to defend its country while also trying to destroy you utterly! NUKEWAR is very fast-paced and easy to learn, and can be enjoyed equally by game players of all ages and levels of experience. Best of all, once the nuclear war is over, you can bring the two countries back to life and try it again!

This SOLITAIRE game includes software and instructions for the following computers: TRS-80* Level II, 16K Memory Apple II*, Applesoft* BASIC, 16K Memory beyond BASIC Pet*, 16K Memory

PLANET MINERS (\$15)

PLANET MINERS gives one to four players the chance to compete with each other and the computer to stake valuable mining claims throughout the solar system in the year 2050. Each player must decide which ships to send to which planets and when to try "dirty tricks" like sabotage and claim-jumping. If there are less than four players, the computer takes the other parts. (It can even play all by itself!) Thus, PLANET MINERS can either be played solitaire or with friends.

This 1-4 player game includes software and instructions for the following computers: TRS-80* Level II, 16K Memory Apple II*, Applesoft* BASIC, 16K Memory beyond BASIC Pet 2001*, 16K Memory

B-1 NUCLEAR BOMBER (\$15)

This game gives you an opportunity to be the pilot of a B-1 bomber on a mission over the Soviet Union. You must fly the plane through the stiff Russian defenses to the target city, bomb it, and return home. Your computer controls the Soviet air defense bases with their almost unlimited numbers of MIGs (fighters) and SAMs (Surface-to-Air Missiles). Your only chance to get through is to rely on the superior technology of your sophisticated ECM (Electronic Counter Measures) and self-defense missiles. When all else fails, you can try violent evasive maneuvers.

This SOLITAIRE game includes software and instructions for the following computers: TRS-80* Level II, 16K Memory Apple II*, Applesoft* BASIC, 16K Memory beyond BASIC Pet*, 16K Memory

MIDWAY CAMPAIGN (\$15)

MIDWAY CAMPAIGN is a computer simulation of the battle for Midway Island. Your microcomputer controls a huge force of Japanese ships whose objective is to invade and capture Midway Island. If the Japanese can win air superiority over Midway, the success of the invasion is virtually guaranteed. If not, they will be forced to turn back to prevent the loss of irreplaceable troops who would be totally vulnerable in their invasion craft. In the actual engagement, the Japanese made several tactical errors which cost them the battle. Your computer probably won't make the same mistakes! You command the badly outnumbered and outanged U.S. Navy forces. Your only advantage is surprise.

This SOLITAIRE game includes software and instructions for the following computers: TRS-80* Level II, 16K Memory Apple II*, Applesoft* BASIC, 16K Memory beyond BASIC Pet*, 16K Memory

CARD DRAW

by Arthur A. Glecker

CARD DRAW

Card Draw is a 16K S-80 Subroutine.

SUBROUTINE TO "MANAGE" A DECK OF CARDS

Most TRS-80 owners are familiar with card - playing games for computers, especially since a Blackjack tape is included with the TRS-80. The purpose of this article is to acquaint users with some methods of "deck management."

The first method that comes to mind is to have the computer select a number between one and 52 (inclusive), then compare it to the corresponding element of an array in which each element represents one particular card. If the number in that element of the array indicates that the card has already been used, the computer starts over, randomly selecting a new number.

This method is both slow and uses an excessive amount of

memory for the array. If there is only one card left, it may take a seemingly endless time to generate a random number that corresponds to the card.

The method used in Radio Shack's Blackjack game is much better, time-wise, than the one described above. Also, it can be (and is being) used on Level One machines. However, it still uses a great amount of array space.

I will not explain the Radio Shack method here, but the reader many certainly examine a copy of Blackjack, beginning at line 200, to discover it.

The following subroutine, which can be used in almost any Level Two program, uses nine variables, and only two of the nine (CD\$ and CD) must be "preserved" throughout the main program. (The routine "assumes" that when it is first used during a run, CD is set to zero.

When the subroutine is first called, or after the cards have all been used, CD equals zero, and line 1030 is reached. At 1030, a

string variable (CD\$) is set up using the first 52 ASCII characters, each representing a card. CD is set to one so that 1030 will not be reached on later calls of the subroutine unless CD is changed.

At 1040, a random number is chosen which is between one and the length of CD\$, inclusive. This random number, C2, corresponds to a character within CD\$, the ASCII code of which is put into C3.

At 1050, the character indicated by C2 is removed from CD\$ so that the card will not be picked again. This is accomplished by concatenating (fancy word for "combining two string variables") all the characters to the left of C2 and all the characters to the right of C2 to get a new value for CD\$.

At 1060, the length of CD\$ is checked. If the length is zero, all the cards have been used. CD is set to zero so that a new string (CD\$) can be set up the next time the subroutine is accessed (line 1030 will be reached). OD can also be used as a flag to the main program to indicate that one deck has been used, in case the program is only supposed to use one deck.

At 1070, the proper suit is calculated using C3.

At 1080, a loop subtracts 13 from C3 until C3 is less than 14. This is to allow lines 1090 to 1220 to select the proper card name within the suit.

Finally, at 1230, the suit and card names are concatenated as CN\$, which is returned to the program as the card's name.

**Board Games-1,
CS-3001 (16K)**

- **Mugwump** \$7.95
Mugwump is a board game which uses a 10x10 grid on which four friendly Mugwumps are hiding. Your mission is to locate these mysterious animals and capture them.
- **Flip Disc**
Are you an Othello freak? Flip Disc is a program which will turn your computer into an excellent opponent. Three different skill levels, (good, expert, and genius), provide an introduction for the novice and continuing interest for the experienced player.
- **Wumpus**
In game 1, you scour a network of underground caves in search of the prized Wumpus. Bagging a Wumpus wins the game, but if you accidentally stumble into his cave, the Wumpus will enjoy a tasty dinner of sauteed computer freak.
- **Wumpus 2**
If you master the dodecahedron cave network in Wumpus 1, you may proceed to Wumpus 2 which allows you to choose from five different caves, or you can design your own.

- **Qubic**
Qubic is a three dimensional Tic Tac Toe game. The game is played in a 3 dimensional cube (4x4x4). The object is to outwit the computer and place four pieces in any straight line.
- **Backgammon**
This is the TRS-80 adaptation of the popular board game. Backgammon uses graphics and all the standard backgammon rules, not a strange computer variation. The computer is your opponent in this version, written by Scott Adams of "Adventure" fame.

**WRITE FOR...
FREE
SOFTWARE CATALOG**

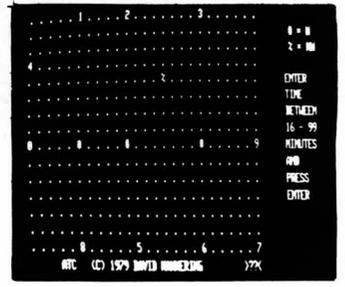

**Space Games-3,
CS-3002 (16K)**

- **Ultra-Trek** \$7.95
Ultra-Trek is a fast-paced version of Star Trek, complete with "real time" action graphics, lasers, Nilon space mines, high energy photon torpedoes, enemy ships that move, and an experimental ray which does something different each time you use it. You must act quickly to save yourself and the Federation.

- **Star Lanes**
Imagine yourself the president of an intergalactic shipping company. If you're successful, you may be named Imperial Advisor on Economic Affairs. Entrepreneurs: to your ships.

- **Star Wars**
If you hate Darth Vader, you'll love Star Wars. This real time game is fun for aliens of all ages. May the Force be with you!

- **Romulan**
Your mission is to destroy an invading Romulan space craft. Maneuver through space and around stars looking for the deadly enemy, but be careful! The nasty Romulans fire back.

**Air Traffic Controller,
CS-3006 (16K) \$7.95**

This real time machine language program puts you in the chair of an air traffic controller. There are 27 airplanes — jets and prop planes — which must be controlled as they land, take off and fly over your air space. You give the orders to change altitude, turn, maintain a holding pattern, clear for approach, and land at your two airports. This realistic simulation includes navigational beacons, and requires planes to take off and land into the wind. Air Traffic Controller was written by an air traffic controller and is a favorite of the Creative Computing staff!

You'll love this Adventure; in fact, you might say it's LOVE AT FIRST BITE ...

CS-3011 TRS-80 Level II \$14.95
(Available in November)

Strategy Games, CS-3005 (16K)

• Tunnel Vision \$7.95

You are transported into a massive labyrinth and must find the exit or be lost forever. This is an excellent example of three dimensional perspective using TRS-80 graphics.

• Evasion

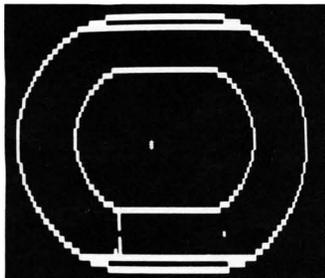

In this real time game, you are pursued around the game board by an evil-looking snake. Variations of play include two different speeds and hyper-jumps which randomly relocate you on the board. Looking for an escape? Try Evasion.

• Jigsaw

Jigsaw is a computer-age puzzle game making extensive use of TRS-80 graphics. The computer generates a random puzzle and puzzle board. Using a combination of deductive reasoning and luck you must fit the graphically represented puzzle piece into place.

• The Masters

Are you a wandering pro or just a Sunday golfer who would like to keep in practice? Once you're on the green, a worm's-eye view is displayed for putting.

• Motor Racing

Motor Racing combines real time racing action with advanced graphics functions. The graphics and animation make Motor Racing fun to watch as well as play.

Pursuit Games, CS-3004 (16K)

• Stock Car Race \$7.95

Stock Car Race is a real time racing game on a road race circuit.

• Maze

You are timed throughout your run and rated on the basis of elapsed time and the number of moves required to escape. Nine skill levels.

• Indy Racer

Indy Racer is a real time racing game for the TRS-80. Similar to the popular arcade-style driving games.

• Depth Charge

As commander of a destroyer, your mission is to destroy as many enemy subs as possible in this re-creation of the Battle of the Atlantic.

• Kaleidoscope

This graphics demonstration program turns your TRS-80 into a computer age kaleidoscope.

Creative Computing Magazine

Creative Computing has long been Number 1 in applications and software for micros, minis, and time-sharing systems for homes, schools and small businesses. Loads of applications every issue: text editing, graphics, communications, artificial intelligence, simulations, data base and file systems, music synthesis, analog control. Complete programs with sample runs. Programming techniques: sort algorithms, file structures, shuffling, etc. Coverage of electronic and video games and other related consumer electronics products, too.

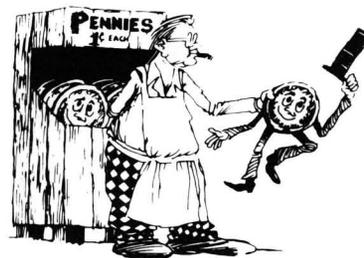

Just getting started? Then turn to our technology tutorials, learning activities, short programs, and problem solving pages. No-nonsense book reviews, too. Even some fiction and foolishness.

Subscriptions: 1 year \$15, 3 years \$40. Foreign, add \$9/year surface postage, \$26/year air.

The Best of Creative Computing

The first two years of **Creative Computing** magazine have been edited into two big blockbuster books. **American Vocational Journal** said of Volume 1, "This book is the 'Whole Earth Catalog' of computers." [6A] Volume 2 continues in the same tradition. "Non-technical in approach, its pages are filled with information, articles, games and activities. Fun layout." — **American Libraries**. [6B] Each volume \$8.95.

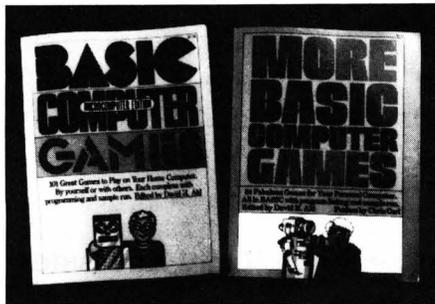

Computer Coin Games

Computer Coin Games by Joe Weisbecker aids newcomers to the field of computers by simplifying the concepts of computer circuitry through games which can be played with a few pennies and full sized playing boards in the book. Enhanced by outrageous cartoons, teachers, students and self-learners of all ages will enjoy this 96 page softbound book. [10R] \$3.95.

Basic Computer Games

Edited by David Ahl, this book contains 101 imaginative and challenging games for one, two, or more players — Basketball, Craps, Gomoko, Blackjack, Even Wins, Super Star Trek, Bombs Away, Horserace. Simulate lunar landings. Play the stock market. Write poetry. Draw pictures.

All programs are complete with listing in Microsoft Basic, sample run and description. Basic conversion table included. 125,000 copies in print. 192 pages softbound. [6C] \$7.50.

More Basic Computer Games

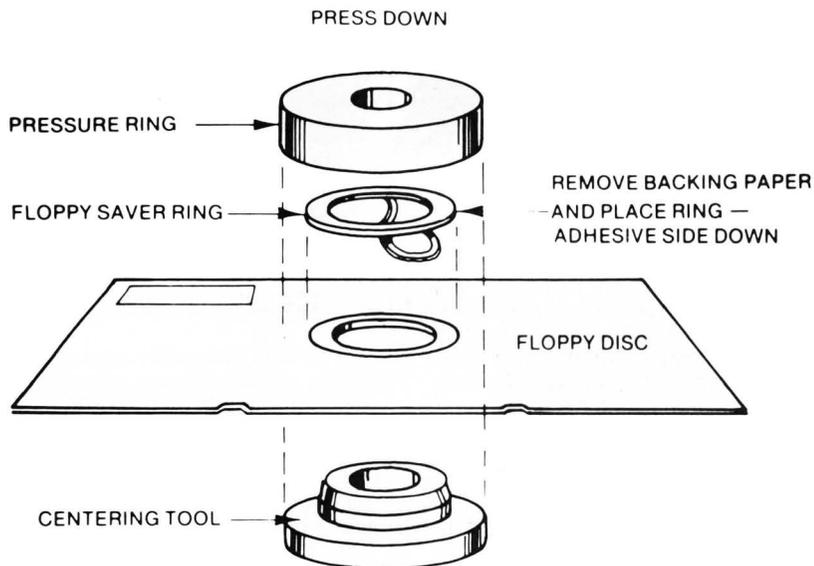

Contains 84 fascinating and entertaining games for solo and group play — evade a man-eating rabbit, crack a safe, tame a wild horse, become a millionaire, race your Ferrari, joust with a knight, trek across the desert on your camel, navigate in deep space.

All games come complete with program listing in Microsoft Basic, sample run and description. 192 pages softbound. [6C2] \$7.50.

How To Order

Send order and payment to **Creative Computing**, P.O. Box 789-M, Morristown, NJ 07960. Add \$1.00 shipping and handling per order (foreign, \$2.50) N.J. residents add 5% sales tax. Visa, MasterCard and American Express orders welcome. For faster service, call in your bank card order toll free to: 800-831-8112. (In NJ, call (201) 540-0445.)

 AND TRS-80

"MONTY™ plays Monopoly™" is a computer opponent program designed to be used along with your Parker Brothers Monopoly game. You will need the board and all of the equipment that comes with the game to use this computer opponent program.

MONTY™ provides a new dimension in microcomputer software. You will come to know him as simply another player, a bright, entertaining guest who provides real excitement for many of your favorite board games.

MONTY™ written in machine language, works with a 16K TRS-80 Level II or 16K Apple or Apple II plus. Cassette \$24.95. Diskette \$27.95.

S-80 VERSION

```
100 CLS:INPUT"INSTRUCTIONS";A$:IFLEFT$(A$,1)="Y"THENCLS:GOTO310
```

Line 110: Initialization. If you want to play again, this is where the program will GOTO.

```
110 RANDOM:CLS:DEFINTA-Z:P0=0:L=15390:S=30:G=0:S%=CHR$(135)+CHR$(188)+CHR$(139):E%=CHR$(133)
```

Line 120: This is where I make all those plus signs go up the screen. I put a meteor at a random position at the bottom of the screen and don't suppress the line feed. The computer then scrolls the entire screen upwards and makes it look like things are moving. Your score is printed in the upper-left corner. There is no penalty for flying over your score (except for a certain amount of difficulty in reading it).

```
120 PRINT@G," ";PRINT@RND(62)+960,"+":PRINT@0,P0;
```

Line 130: Right here I find out which arrow keys you are HOLDING DOWN. If you are holding down the left arrow, the value at peek location 14400 will be 32. If the right arrow is pressed, the value will be 64. More on that later.

```
130 P=PEEK(14400):IFP=32L=L-1:S=S-1ELSEIFP=64L=L+1:S=S+1
```

Line 140: I keep you within limits right about here. Anywhere between 1 and 61 will do.

```
140 IFS<1S=1:L=L+1ELSEIFS>61S=61:L=L-1
```

Line 150: Once I know where you are, I should like to know if you've been hit. You are sitting at 3 places on the screen and if any of those spaces contain a meteor (ASC("+")=43) then you have been hit.

```
150 IFPEEK(L)=43ORPEEK(L+1)=43ORPEEK(L+2)=43THEN200
```

Line 160: If you haven't been hit yet, then I will put you on the screen.

```
160 PRINT@S,S$;
```

Line 170: When G=0, you aren't shooting. Therefore it would be nice to find out if you would like to shoot (nothing like having your guns fail you when a meteor is examining your nose hairs). If you have just hit the space bar, then the shot's position is right in front of you. If you hit the enter key (CHR\$(13)) instead of the space bar, you will be sent to the hyperspace routine.

```
170 IFG=0A%=INKEY$:IFA%=" "THENG=S+65ELSEIFA%=CHR$(13)GOTO250ELSE190
```

Line 180: This line takes care of the shooting. It moves the shot down to the next line and checks to see that it is still on the screen. If so, a check is made to see if a meteor has been hit. One PEEK finds where it is, the other checks to see if it skipped something (when the shot goes down and the screen scrolls up, it may try to skip one of those little buggers). If you did hit something, the program will go to the appropriate explosion routine. If you pressed the ENTER key, it will go to the hyperspace routine. If you did none of the above, then it will put your shot back on the screen. If the shot has gone off the bottom of the screen, it will be reset to zero and the INKEY\$ buffer will be cleared (wasn't that a doozie of a line?).

```
180 G=G+64:IFG<1024IFPEEK(15360+G)>32GOSUB230ELSEIFPEEK(15296+G)>32GOSUB240:GOTO120ELSEA%=INKEY$:IFA%=CHR$(13)THEN250ELSEPRINT@G,E$;ELSEG=0:A%=INKEY$
```

Line 190: This is the bottom of the loop. If you ain't dead yet, it will add one to your score and jump back to the top of the loop (line 120).

```
190 P0=P0+1:GOTO120
```

Line 200: This is your ship's explosion routine. It puts a white flash on top of your ship, sets up some variables, waits, and then erases the flash.

```
200 PRINT@S-1,STRING$(5,191);:S1%=LEFT$(S$,1):S2%=MID$(S$,2,1):S3%=RIGHT$(S$,1):S1=S:S2=S+1:S3=S+2:FORI=1TO50:NEXT:PRINT@S-1,"";
```

Line 210: First it erases the old debris, moves the pieces, makes certain that they are still on the screen and puts them on the screen again. After that it waits a jiffy and does the whole thing over again.

```
210 PRINT@S1," ";:PRINT@S2," ";:PRINT@S3," ";:S1=S1+63:S2=S2+64:S3=S3+65:IFS1<1023ANDS2<1023ANDS3<1023PRINT@S1,S1$;:PRINT@S2,S2$;:PRINT@S3,S3$;:FORI=1TO50:NEXT:GOTO210
```

Line 220: Waits a couple of seconds and jumps to the "PLAY AGAIN?" routine.

```
220 FORI=1TO1000:NEXT:GOTO270
```

Line 230: If your shot hits a meteor, add 100 points to your score, clear the buffer, flash the screen, wait, erase it, and RETURN.

```
230 P0=P0+100:A%=INKEY$:PRINT@G-1,STRING$(3,143);:FORT=1TO30:NEXT:PRINT@G-1," ";:G=0:RETURN
```

Line 240: Just like 230 only your shot jumped over the meteor instead of landing on it.

```
240 P0=P0+100:A%=INKEY$:PRINT@G-65,STRING$(3,143);:FORT=1TO30:NEXT:PRINT@G-65," ";:G=0:RETURN
```

Line 250: The hyperspace routine. First it sets your shot to zero, then does a neat little trick: if the random number is 1 then it goes to the "HOPELESSLY LOST IN SPACE" routine; if it is between 2 and 10 then all is well (almost; you still might land on a meteor).

```
250 G=0:ONRND(10)GOTO290
```

Line 260: This is hyperspace. It will make between 1 and 75 meteors go flying up the screen (be careful when using hyperspace in any form). The extra PRINT makes things move a little faster. The T%=INKEY\$ just clears the buffer. Then back to the top of the loop.

```
260 FORI=1TORND(75):PRINT@RND(62)+960,"+":PRINT:NEXT:T%=INKEY$:GOTO120
```

Line 270: This is the endgame or "PLAY AGAIN?" routine. First it checks to see if your score is higher than the previous high score. If it is, then it jumps to line 360 otherwise it prints the high scorer and his score, then tells you what your score was.

```
270 IFP0>HPTHEN360ELSEPRINT@25,HP$:"";HP::PRINT@45B,"YOU EARNED" P0"POINTS ON THAT MISSION";
```

Line 280: Here you are asked if you want to play again. Press ENTER if you do, or press "N" and ENTER if you don't. If you do, control goes to line 110 (the initializing line).

```
280 PRINT@523,;:INPUT"DO YOU WANT TO TRY ANOTHER MISSION";Y%;IFL
EFT$(Y%,1)="N"THENENDELSE110
```

Lines 290 and 300: This is the hopelessly lost in space routine. The time you spend in hyperspace is a little longer so as to make you nervous (ain't I a stinker?). Next, I inform you that you are hopelessly lost).

```
290 FORI=1TO100:PRINT@RND(62)+960,"+":PRINT:NEXT
300 PRINT@396,"YOU ARE HOPELESSLY LOST IN SPACE";GOTO270

APPLE VERSION

James Garon and Mark Pelczarski

The one distinctive feature of the Apple Meteor Storm program is its use of text commands to produce low resolution graphics. The S-80 and Atari both have graphics symbols that can be put on a text screen. The Meteor Storm program uses the text screen for its motion by scrolling the entire display and only redrawing the ship at the top of the screen. This gives the effect of the ship moving at the meteors, when in actuality it's the opposite. The problem in converting the program to Apple was the discrete graphics and text modes. To use the scrolling, one would be confined using text characters as the only graphics ('x' as a meteor, for example).

After a bit of playing around, however, we discovered that you could trick the computer into thinking it's displaying low resolution graphics. The first step is to clear the screen and go into Lo-Res graphics mode (see line 110). When you set Lo-Res graphics, the text window is reduced to the bottom four lines. Hidden away in the Applesoft manual is a POKE command that lets you set the top of the text window wherever you want. Surprise! Poking that location with a zero (the top line on the screen) suddenly allows us to print anywhere - not just the bottom four lines. But anything printed above those four lines is still interpreted as a graphics character (actually two characters stacked on one another; a text character is

twice as tall as a Lo-Res graphics block). Furthermore, when the screen is scrolled, now the entire page moves up, graphics and all, instead of only the bottom four text lines.

The trick now is to discover what to print to get the graphics colors you desire. For that we turned to pages 15 and 17 of the Apple Reference manual (spiral bound version) where there are tables of all the ASCII characters and the color codes for Lo-Res graphic blocks. One text character will print two graphics characters. Working by the hex codes, if we wanted a light green block (\$C) on a pink block (\$B), you print the character \$BC, which in the ASCII table is a Normal ' ' (as opposed to Inverse or Flashing). It gets a little messy, but you can now see why a line of background characters (L\$) is set to CHR\$(34). 34 in hex is \$22, which gives two dark blue blocks. Each graphics shape was created the same way - deciding the colors needed and then finding the corresponding characters.

A-counts how many thousands of points the player has, controlling the meteor colors.

A\$-user answer

B-A mod 4 (meteor color)

B\$-one character of background color

E\$-character used for missile (the right bracket is a Shift-M)

F-flag that tells in which line the hit meteor is in.

G-row in which missile is

H-used in checking whether meteor is hit (each time two rows must be checked since the missile advances and the screen scrolls)

HP-high player score

HP\$-high player's name

I-loop index

L\$-one line of background characters

M\$(0-3)-meteor characters; four variations, dependent on score.

P-paddle setting (-1,0,1)

P1-score

S-horizontal location of ship

S\$-ship characters

S1,S2,S3-locations for ship fragments after explosion

T-timing loop counter after meteor is hit

Y-vertical location of ship fragments after collision

Initialize background string and meteor characters.

SARGON II

At HAYDEN, The Best Has Gotten Better.

Sargon, the program that came in first in the Creative Computing Microcomputer Chess Tournament, has become Sargon II. The game has been vastly improved and now has a faster response time. A new Level 0 has been incorporated for beginners. The board is easier to pre-set and there is now a Hint mode that provides suggestions from the computer. Sargon II took on the maxi-computers in the West Coast tournament and finished in the money! Shows more thinking power than you ever expected.

Sargon II 16K Level II Cassette \$29.95 (TRS-80)
Sargon II 24K Cassette Machine Language \$29.95 (Apple)
Sargon II 32K Disk \$34.95 (TRS-80)
Sargon II 48K Disk Machine Language \$34.95 (Apple)

GAME DESIGN

by Ron Potkin

Ron Potkin also wrote our feature program for this issue, Kriegspiel.

The most important point to bear in mind when designing a computerized game, is that the computer is merely a tool. It should be as unobtrusive as possible: Do not try to introduce features that detract from the playing of the game. Making the game playable and absorbing is a must.

If you have a good idea for a game do not spoil it by not paying attention to detail. We can take it for granted that it will work satisfactorily and do all that you intended it to do, but will it appeal to anyone else? It's all a question of cosmetics.

Pay attention to rhythm - do everything you can to get rid of irritating delays. On the other hand, it may be that you must introduce timing delays - make sure they are the right length.

Try to keep the player's attention. Do all you can to keep processing to a minimum. If a particular routine causes a long delay, think about converting it to machine language, using the string packing technique. It takes time, but the final result is worth the effort.

Avoid scrolling the screen after every turn. It should be possible to keep the board or cards on the screen at all times and update it using the "PRINT @" function. Use a flashing routine so that the player can see what has happened.

If possible, use graphics rather than keyboard characters. The letters tend to strain the eyes after a time and are unrealistic. In "STUD POKER," graphics were used to indicate the suit. This was easier to follow than merely "JC."

Should sound be introduced? One needs to think about this carefully. Sometimes, particularly in arcade type games, sound is a must, but in others it is really desirable? In "KRIEGSPIEL" I decided that tanks should not fire at each other with laser beams, so I omitted it. I also felt that it

would distract the player. This is an example of putting the computer before the game.

Keep the input requirements simple. Don't ask the player to enter complicated angles to the nearest degree. After all, that's what computers are for. If I knew the answer, I would not have bought one!

Comments are another problem. Naturally, they are needed to insure that the player knows the rules and is corrected if he makes a mistake, but do not use them unless they are apt. They can be comical but - and this should be a cardinal rule of computer games - do not talk down to the player or be rude. The first time it may be funny but he probably will not play it again. The trouble with comments that are included just to liven up the game is that they tend to be repetitive and therefore a large number of them are needed (60 to 80 is not unreasonable) so that they repeat at infrequent intervals. That will eat up a great deal of memory, so if you are not sure, they should be omitted.

Finally, play the game as often as you can and check the points above. Did you become bored? If you did then so will everyone else and sooner. Come back to it after a month. Does it still appeal to you? It does? That's good. Send it to our friends at "SOFTSIDE." Provided it is original they may be interested.

S-80 PROGRAMMING HINT

If when typing in a long line the computer will not accept any more characters, enter as much as you can and then EDIT the line, type X, and continue typing. You should be able to insert about 15 more characters.

If you operate in Level II BASIC with an expansion interface and you wish to return to the MEMORY SIZE question, type: SYSTEM /117

This is the exit used by the DOS BASIC 2 command.

SOFTSIDE'S DATA BASE

by Mark Pelczarski

**S-80 translation by James Garon,
Atari translation by Rich Bouchard**

Part Three - Sorting

Now that you can put things into your data base, modify them, and get them back out, it's time to consider what can be done with information that's been stored. This month we'll add a sorting routine that will allow you to sort in ascending or descending order on any heading. Ascending order would be used for something like alphabetizing a list of names. Descending order would be used to list amounts from greatest to smallest, for example. Next month we'll add a search routine that will allow you to find an item or group of items quickly and easily, without needing to know record numbers.

The type of sorting routine that we chose is actually the brute force method. The technique is to simply go through the entire list and find the smallest item, put it in position one, find the next smallest, put it in position two, and so on. It's not the fastest sorting routine around, but in our case it does work better than some that would usually be faster. If there are N items in the list, only N-1 interchanges are made. The advantage this creates with our program is that an interchange (swapping the positions of two items) actually requires a switch of each pair of items across the record (names, addresses, phone numbers, etc., instead of just the name). Being rather time consuming, it's nice to minimize the number of swaps. Once again, in the future we'll have occasion to talk about much more elegant methods of sorting.

The actual routine itself is rather short. Two lines must be added in the main routine to present and accept the sort option. (In the Atari version, we've also added a couple of TRAP statements that will catch a blank input and not crash the program. We also had to dimension a temporary string variable, T\$, that will be used in the interchange process. This is

done in both the load and add routines, which is where the record length is calculated.) The first line of the routine checks if there is anything actually there to sort. Then in lines 7010 to 7050 the user is asked to choose the heading under which the sort should be performed (the choice is stored in J1). In lines 7060 to 7090 the user chooses ascending or descending order for the sort. A switch, A, is set to 1 for ascending, or 2 for descending.

The main loop of the sort routine goes from line 7100 to line 7180, and uses 'I' as a counter from position 0 in the array to the next to last (NI-1) position. Each time through this loop the smallest (or largest) item remaining will be selected and put in the Ith position. To do this, another variable T keeps track of the smallest item found at any given point. It starts out equal to I, since none of the other elements have been checked. Then the inner loop (7120-7145) compares the Tth element with each other element to the end of the list, changing T if it finds something smaller. Line 7122 just prints something on the screen for you to count while you wait (and can be removed). The numbers printed are the loop counters and should give you an idea of how the sort progresses. Line 7125 simply directs the program to the proper IF statement, depending on the value of A. Upon completion of the inner loop, T holds the index of the smallest or largest item. If this happens to be the Ith element, the interchange is skipped; otherwise the loop from 7150 to 7170 swaps the Ith and Tth records. T\$ is used as a temporary holding variable, which is necessary for interchanges. The last step is to set the save switch (SS) to zero, meaning a change in the file has been made since the last time it was saved.

Data Base Input

Dear SoftSide,

September's DEVELOPING DATA BASE is fantastic. The only problem I had was in predicting output appearance for

long strings. Changing line 4020 to

```
4020 PRINT H$(J);: PRINT  
“:”;: INPUT “”;I$(NI,J)  
gives an input format which  
matches the output format.
```

sensational software

ADVANCED AIR TRAFFIC CONTROLLER

This real-time machine language program puts you in the chair of a busy air-traffic controller. 27 prop planes and jets are depending on you as they take off, land and fly over your air space. You give orders to turn, maintain a holding pattern, change altitude, approach and land at either of two airports.

Written by an air traffic controller, this realistic fast-paced simulation includes navigational beacons and the requirement that planes take off and land into the wind. The program's continuously variable skill level assures that you won't soon tire of this instructive and absorbing simulation.

In **Air Traffic Controller** you assume responsibility for the safe flow of air traffic within a 15 x 25 mile area up to 5,000 feet in altitude. During your shift as a controller in charge of this airspace 26 aircraft become active and under your control. Jets and prop planes have to be guided to and from the two airports, navigational beacons and ten entry/exit fixes. The aircraft enter the controller's airspace at various altitudes and headings whether or not you are ready.

Air Traffic Controller retains the basic realism of air traffic control. This program requires the same steady nerves under pressure and the same instant, almost instinctive, analyses of complex emergencies which are demanded of a professional air traffic controller. But "ATC" adds the excitement and well-defined goals of a game. This is just a simulation, and all passengers left in air traffic limbo by a panicked player will live to fly another day.

Air Traffic Controller is available for the 16K TRS-80, the Apple II, and Apple II plus on cassette for \$9.95

**THE
NATIONAL
COMPUTER
SHOWS**

HAVE WE GOT A PROGRAM FOR YOU!

The new computers are showing off. Over \$50 million worth of equipment in over 100,000 square feet of space, including the latest software and hardware for business, government, home and personal use. Everything the NCC show has and more will be on display, and you can buy it all right on the spot.

Computers costing \$150 to \$250,000, mini and micro computers, data- and word-processing equipment, telecommunications, office machines, peripheral equipment and services from leading names in the industry like IBM, Xerox, Radio Shack and Apple will all be there.

There'll be conferences on business uses of small to medium sized computers, and how to make purchasing evaluations.

There'll be robots, computerized video games, computer art and computer music.

Everyone from kids to people who earn their living with computers will have a great time at the largest computer show ever organized in each region.

Admission for adults is \$5. The public is invited, and no pre-registration is necessary.

Don't miss the computer show that mixes business with pleasure. Show up for the show.

KRIEGSPIEL

by Ron Potkin

This program is for a 16K S-80

SOLDIER! PICK UP YOUR MUSKET!

About three years ago I bought several boxes of those small one-inch high plastic soldiers. They represented the French and British from the Battle of Waterloo. In all there must have been 400-500 pieces. The next three months were spent painting the detail on each piece using a magnifying glass, but after the first 100 I regret that my enthusiasm began to wane. There is no doubt that the sight of several hundred warriors lined up for battle is very appealing but I felt there had to be an easier way.

All this occurred about 12 months before the "Birth of the Byte." I had played several commercial wargames and although they were very interesting, there was a lack of realism because I felt that a General should be allowed to concentrate on the battle and not be tied down to rolling dice and consulting charts. The TRS-80 has changed all that. Think of the advantages:

It determines when conflict should occur and the nature of the conflict.

It rolls the dice and resolves all combat between opposing sides.

It is an impartial referee.

It will not tolerate heavy breathing or that gasp of relief that moves a complete armor division across the Mediterranean.

Real hidden movement is possible. No longer does one need to write down on a piece of paper the current location of each hidden piece.

It was with these points in mind that I wrote "KRIEGSPIEL."

While designing the game. I had to consider:

The minimum size of hex.

The shape of each piece.

The necessity to be able to distinguish pieces on each side. Each must be oriented left or right so squares and oblongs are out.

Keyboard characters are

unrealistic. When playing, one should be totally involved and feel as though the battle is really happening: I am afraid the letter "A" for army does not turn me on.

I finally determined that four bytes were required to build up a neat shape and meet all my requirements. After allowing for a line of messages and spaces between the pieces. I had a board of about 120 hex. In "KRIEGSPIEL II," I have adopted a different approach so that it is possible to have 500 hex.

I think you will enjoy the game. My son Leigh, and I have played it many times and have developed our own personal strategies. Invariably, one scenario becomes particularly interesting and we play it over and over

"KRIEGSPIEL II" is a further development of this game with more pieces, minefields, weather, recruiting, a larger board and other features, but the same basic strategies apply.

I am not going to give any advice on tactics other than to urge you to study the table of odds very carefully before you attack.

Before getting involved in the detailed programming, you should understand the overall operation of

the program. There are four arrays which control all movement and attack these are:

1. Video screen - Run the program and put the hex board on the screen. Each hex is numbered according to its first "print 0" position. The top left-hand hex is number 4. The next is number 12 and so on up to 60 in steps of 8. The second line runs from 64 to 120. Note that alternate rows are offset by four so that the hexes fit together. The same format continues down to hex number 956 leaving the bottom line for messages. Let's look at a section of the screen using hex number 400 as an example (Figure 1). Now deduct 400 from every number to arrive at the offsets (Figure 2). If we know the direction. These enable us to move a piece from one hex to another. We could calculate them but it is faster to use "on-direction-goto" (Line 21500). As an alternative a table of values could be used.

2. Piece table "PC" - This is a 32 by 6 array and contains details of the 16 pieces on each side. The first column is the current hex number position on the screen. The second contains the type of piece - tank, infantry, engineer or capital. The other four columns

contain combat pointers which will be described later. When a piece is eliminated, column 1 is set to zero.

3. The board "BO" - This is a 16 by 16 array, including the zero index and is an internal representation of the map. Each indexed position is equal to one hex on the screen. Each vacant position on the screen is set to zero on the board. An occupied position contains the index of that piece in the piece table. Positions occupied by mountains contain -1, -2, or -3 according to the type of mountain.

4. Characters "PC\$" - This is a 7 by 4 character string holding the shapes to be printed on the screen. The correct character is obtained by means of its index in the second column of the piece table.

It will be apparent from figure 3 that, using the information in each of the arrays, we can easily move from one table to another. There is one missing link: This is the conversion from the hex number to the board coordinates which is carried out in line 2100:

$$Y1 = \text{INT}(P/64)$$

$$X1 = (P - 64 \cdot Y1) / 4$$

(Where "P" is the hex number)

Much of the program is concerned with the manipulation of these arrays. It is in motion by putting the initial hex position of each piece in each array and then running through the piece table prompting for a decision on each piece in turn. Assuming the piece is on hex 400 (Figure 1) and you type direction 6, the program calculates the board coordinates, checks that hex 352 is vacant and, if it is, moves the piece. It now checks the six hexes surrounding the new hex to see whether it is next to an opponent. One side has indices 1 to 16; the other 17 to 32: So if piece 12 (less than 17) is next to piece 24 (greater than 16), an attack takes place and any further movement ceases.

The following is an outline of the movement sequence:

1. Line 200 controls the whole game. At the end of a player's turn, the program returns here and changes sides.

2. Turns are determined by "5" in line 1000 which sets the variable 1, to either 1 or 17 indicating the index of the first piece to be moved.

3. Gets the hex number FL, the

number of moves "MV," and the character "FL\$" (lines 1010, 1020)

4. Prompt for a decision by flickering "FL\$" and "MV." (line 1030)

5. If the input is a number, check if valid and either move the piece or continue prompting. (lines 1050 -1210)

6. Checks during movement (line 1065) for the winning condition.

7. Line 1075 checks "river crossing." If this is true, an extra movement factor is deducted.

8. Line 1182 checks one hex in every direction using "Search," looking for an opponent.

9. Intermingled in the coding is the "Hold routine. Follow this through watching the variables "HD," "K1," and "HL" in lines 1000, 1010, 1017/8, 1047/8, and 1218.

10. The "C," "S," and "F" commands are easier to follow, but note that "C" jumps immediately to line 1300, whereas "F" carries out a full check of pieces that have not been prompted to check for possible attacks. Since this involves checking six hexes for every piece, it is a slow process and therefore, if it can be seen that no pieces are adjacent, it is better to use "C."

Let us take stock of what we have when we finally reach line 1300 - the start of the attack sequence:

1. The board, video, and piece table have been updated in respect to all movement.

2. Mountains will have been adjusted on the board and video when they have been eaten away by the engineer.

3. Columns 3, 4, 5, and 6 of the piece table contain information regarding attacks. Note that if column 4 is set to one that attack will be automatic and requires no prompting. If it is greater than 1, then a decision is required by the player.

COMBAT SEQUENCE

Lines 1305 to 1500 are a prompting routine and settle all attacks. Note that the use of the flag "22" -This is set to one if an attack is found. If it is zero at line 1550, it means there are no attacks and the combat sequence is finished.

Lines 1600 to 1745 are more complex. They are concerned with determining which pieces are involved in each individual

combat, whether the defender has support; whether the attack is across the river; and finally selecting a random result from the attack table.

A defender table "DR," is set up. This holds details of each defender as it is found in the piece table (line 1620). The attacker is put in the attacker's table "Q" (lines 1680 -1690). We now go through the rest of the piece table searching for any other pieces attacking the same defender. These are added to the "Q" table. As each is added, the attack factor "AT" is increased (and increased again if the attacker is a tank), the river crossing flag is "and" ED with "DR(3)" and column 3 of the piece table negated so that that piece cannot be involved in another attack.

Lines 1700 - 1710 calculate the defender's factors and go to the subroutine at 4000/4200 to check for support.

Lines 1720 - 1740 calculate the attack ratio and find the appropriate column in the attack table from which it selects a random result. If you are like me, you probably find typing the rules is drudgery, so if you want to see the attack table, look at lines 20162 - 20167. Now read through lines 40192 - 40415 which tell you the outcome for each value in the table.

Note the use of the flag "RV," which indicates whether the attack is across the river. The rules state that the defense factor is doubled unless the defender is also being attacked on the same side, of the river. Put simply, this means that if the river flags of all attackers (column 6 of the piece table) are set, then the attack is across the river. If any flag is not set then all others are nullified and the defense is not doubled. This result is very easily obtained by using the "And" instruction and what at first appears extremely complex is resolved in a single instruction!

continued on next page

continued from previous page

Lines 1750 to 2500 carry out the results of the combat result "R" as follows:

1. Exchange:

The defender is automatically eliminated (line 24000), but a test must be made to check how many factors the attacker had (line 1706/7). If they were less or equal to the defender's, then elimination is automatic. Otherwise the attacker is prompted for the pieces to be eliminated.

2. Attacker Eliminated:

This is automatic and all attackers are eliminated using the routine at line 25000.

3. Defender Eliminated:

This is automatic and the defender is eliminated using the routine at line 24000.

4. Defender Retreats:

The player is prompted for the direction of retreat and a check is made for legality. If there is no retreat then an "E" is typed and the piece is eliminated. The variable "RD" is a count of the number of hexes moved. Remember that the defender is now allowed to move next to an opponent.

5. Attacker Retreats:

This is essentially the same as "Defender Retreats" except, of course, that all attackers must retreat.

The program now returns to line 1600 to look for further combat. Exit back to the main routine via the return in line 1610.

"EX"	used in exchange to ensure that enough attackers are removed.	"RT"	attack result.
"F2"	attack flag.	"RV"	river crossing flag.
"F3"	flag used when looking for support.	"S"	whose turn is it?
"FL"	current hex number.	"SD"	random number seed.
"FL\$"	current piece character.	"SE"	holds "SD." This is necessary since the number of mountains requested could upset the shape of the river. The river can't be placed first because it would be destroyed by the mountains.
"HA"	pointer to current attacker when looking for defenders in combat sequence.	"SR"	used to create river.
"HB"	maintains count of attackers in table "Q."	"TB"	table of attack outcomes.
"HC"	temporary count.	"X"	coordinates to river graphics to check for river.
"HD"	"hold" variable.	"X1"	hex number to board coordinates.
"HL"	"hold" variable.	"X2"	save "X1."
"HX\$"	hex board request.	"Y"	see "X."
"I"	index to piece being moved.	"Y1"	see "Y1."
"J"	temporary variable.	"Y2"	see "X2."
"K"	temporary variable.	"Z"	hex offset.
"K1"	"hold" variable.	"ZZ"	attack flag.
"KP"	used to save pointer.		
"LN"	used to create river.		
"MS"	used for prompt messages.		
"MT"	number of mountains.		
"MV"	moves left.		
"P"	new hex number.		
"PC"	piece table.		
"PC\$"	piece characters.		
"Q"	table of attackers.		
"R1"	used in random number generator.		
"R1\$"	hex board.		
"R2\$"	hex board.		
"R3\$"	hex board.		
"R3"	used in random number generator.		
"R4\$"	hex board.		
"RD"	retreat count.		
"RN"	random number.		

I hope you will enjoy this program and, maybe, with the help of this explanation, find ways to improve it. I adopted most of the ideas in this game in "Kriegspiel II," but the programming methods changed in several instances. For example, I found that many routines (particularly "search" and "river crossing") could be simplified by using tables of data. Probably the best change I made however was to surround the board with a boarder of 99s. This greatly simplified checking for movement off the edge of the board.

The following is a list of the variables used in the program:

"A"	direction indicator.
"A\$"	input from keyboard.
"AD"	defender support factors.
"AF"	attack ratio
"AJ"	piece in adjacent hex
"AT"	attack factors.
"AX"	"AT" plus 50%.
"B"	temporary variable.
"B\$"	temporary keyboard input
"B1"	piece index in adjacent hex
"B2"	used during initialization.
"BD"	internal board.
"CL"	used in calculating attack result.
"CT"	temporary variable.
"DF"	defender's factors (including support).
"DR"	defender pointers.
"DT"	defender's factors.

FROM STRATEGIC SIMULATIONS . . .

Sink the Bismarck!

Historic wargaming may be the only intellectual hobby which creates more intensely devoted fanatics than home computing. When two wargamers spend an evening refighting a famous battle, they'll spend several hours happily setting up the gameboard, firepower charts, unit strength tables and so forth . . . all before the first shot can be fired! There are such paper and pencil simulations of every famous battle from Shiloh to El Alamein. If you've ever tried one, you already know the excitement and challenge of trying to be a better general than Rommel.

If you've got an Apple II Plus (or an Apple II with Applesoft Firmware ROM Card) with 48K memory and a 5 1/4" mini floppy disk drive, you can be playing Computer Bismark in a few days. For \$59.95, you get the game program disc, 2 mapboard charts (for plotting secret strategies in grease pencil between moves), 2 ship data charts, 2 system command cards, a loading instruction sheet, and a rulebook. \$59.95
 Computer Bismarck is also available for the TRS-80 Level II on cassette for \$49.95
 Disk \$59.95

Ambush!

Computer controlled mapboard of a typical French village.

Step-by-step computer regulated play.
 Extensive line of sight rules providing for hidden movement.
 Each soldier individually rated for strength, intelligence, dexterity, and marksmanship.
 Realistic weapons, characteristics, and explosives.
 Sophisticated movement rules permitting running, walking, crawling, dodging, and sneaking.
 Simultaneous execution of orders.
 Ability to save a game in progress and restart it at a later date.
 Playing time 1 to 5 hours. 48K Machine Language - Disk \$59.95

INTERACTIVE FICTION

Step into a new dimension in literature.

NEW! From Adventure International

Traditionally, literature has been a one-way medium. The information flow was from the novel to the reader, period. Interactive Fiction changes this by permitting the reader to participate in the story itself.

The computer sets the scene with a fictional situation, which you read from the terminal. Then you become a character in the story: When it's your turn to speak, you type in your response. The dialogue of the other characters, and even the plot, will depend on what you say.

Robert Lafore, writer, columnist, and programmer, has created a series of works in Interactive Fiction. Each is available on a 5¼" diskette for use on a TRS-80* Level-II with at least 32K memory and one disk drive.

Six Micro Stories offers a good introduction to Interactive Fiction. Six very short stories involve you, the reader, in a variety of situations: You are an American spy in Hitler's Third Reich, the pilot of a doomed 747, and more.

Local Call for Death is a detective story in the style of Lord Peter Wimsey. Considerably more challenging than the above program, this one will put your analytic skills (and social savoir-faire) to the test.

Two Heads of the Coin is a psychological mystery set in the London of Sherlock Holmes. Most challenging of all, this program will tax your observational skills and, above all, your imagination.

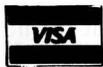

On TRS-80 Disk. Requires User to have a copy of TRSDOS 2.2 or 2.3.

Six Micro Stories	\$14.95
Local Call For Death	\$19.95
Two Heads of the Coin	\$19.95

DUPLICATING SERVICE
609 667-1667

307 West Main Street
Maple Shade, NJ 08052

For *Digital*
needs:

- * AMP "Data-sette" blank cassettes
- * Digital cassette duplication
- * Storage Boxes
- * Labels - Custom printing & blank

For **AUDIO**
needs:

- * On-location music recording
- * Record Album production
- * Stereo and Spoken Word cassette duplication
- * Blank cassette and supplies

All cassette work at AMP R. & D. is custom work to fit your needs.

Call or write to "Jerry" for more information.

APPLE REVIEWS

by Mark Pelczarski

The Microsoft Z-80 Softcard DOS 3.3

One of the dreams of many since microcomputers first became available was that someday they'd be able to do what the big computers could. BASIC is often scoffed at by professional programmers, perhaps unjustifiably if they haven't followed the evolution of the language. But experienced programmers can rightly argue the merits of structured languages with IF-THEN-ELSEs, DO WHILEs (or PERFORM UNTILs), and actual parameter passing to subroutines. These advantages by name wouldn't mean much to those who've used only BASIC, but they sure can make programming much easier. Many have been waiting for micros to offer "real" languages, such as COBOL or FORTRAN.

Apple Computer Company has hoped that Pascal, itself a very good language, would become THE higher level language of microcomputers. A noble cause, but there are notable obstacles. The three most popular computer languages remain to be three of the first developed languages: COBOL for business, FORTRAN for scientific applications, and BASIC on time-shared and micro systems. Many equally, or even more, capable languages have developed, but have met the same fate as the metric system in this country. So when Microsoft announced their Z-80 Softcard, which has the capability of handling FORTRAN, COBOL, and Microsoft's BASIC 5.0, the most advanced BASIC around, and all previously unavailable for the Apple, one suspected that they had a hot item. Not least among the attractions is the fact that Microsoft will also have a BASIC compiler available for the Softcard, something most Apple owners have longed for, capable of making mere BASIC programs travel at the speed of machine language, etc.

The Z-80 is the other microprocessor. Apple, Atari, and PET use the 6502 chip. TRS-80, Cromemco, North Star, and others use the Z-80 chip. Now Apple

users can conveniently live like either half, with both available in one computer. (For the sake of this conversation, I've purposely ignored other microprocessors. That's a whole column in itself.) The Softcard also comes with CP/M, which is really nothing more than an operating system that basically combines Apple monitor-like commands with DOS-like commands. It is, however, widely used in micro-systems.

Having expounded on the possible merits, it should now be noted that all that is currently available is the Softcard with BASIC 5.0, FORTRAN, COBOL, and the BASIC compiler are merely promises for the future; promises which shouldn't be doubted since they've already been developed on other systems, but they will be more than inexpensive additions. The Softcard works flawlessly, plugging into any available slot in your Apple. To reasonably compare prices with the Pascal system you'd actually have to include the cost of a 16K memory expansion card, which gives your Apple the full 64K afforded by the Pascal Language system, and extra room for the Microsoft languages (it is, however, NOT a necessity). Such a card is available from Andromeda Computer Systems, and, even with this included, the Z-80 Softcard is the less expensive alternative.

Much has been made of the fact that with the Softcard you can take advantage of the multitude of software already available for Z-80 systems. True, there is a lot already available for the Z-80, and particularly for CP/M, the operating system most prevalent on micros, especially those which are business based. But it's not yet available on Apple formatted disks. There is the possibility of being able to download through a phone connection, but there may also be problems with that approach with compatibility of the programs with Apple's input/output structure.

Microsoft's BASIC 5.0 is a joy to use. It has several features not available with Apple's BASICs, such as the inclusion of the ELSE clause with an IF statement (If condition is true, THEN do this,

ELSE do that), WHILE and WEND (While a condition is true, repeat these steps), PRINT USING (easy formatting of output), real disk commands (unlike Apple's ungodly PRINT D\$ approach), BUTTON (no more PEEKing to find a pressed paddle button), and HSCRN (to tell whether a point on the HI-RES screen is on or off). To use the HI-RES commands, which are in GBASIC, an extension of BASIC 5.0, you'll have to be able to use a 16 sector disk. The 13 sector version does not support the HI-RES graphics, so you'd need a very new Apple, the DOS 3.3 upgrade, or the Pascal system. Both the 13 sector and 16 sector version are included with the Softcard, along with two nice, thick, and well done manuals: one about the Softcard and the use of CP/M, and the other about BASIC 5.0.

If you are looking for a more sophisticated programming language, or if you were considering the Apple Pascal Language system, the Z-80 Softcard is well worth investigating.

DOS 3.3

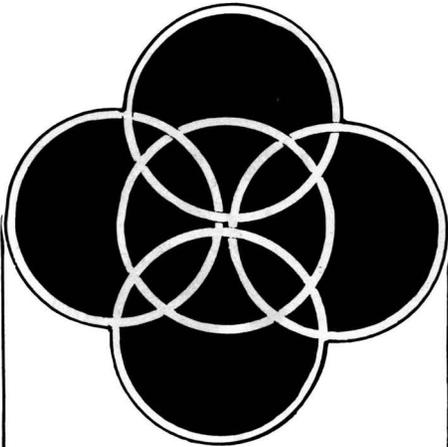

We got a copy of the DOS 3.3 upgrade kit a few days ago. Priced at \$60, it should not be considered a necessity for Apple owners. Its main advantage is that it provides over 20% more room on each disk you use. It also has a single drive copy program included, as well as a file maintenance program, which basically lets you perform DOS commands for files or sets of files in only a few keystrokes. The disadvantage is that part of the upgrade is the replacement of two chips, meaning you can't freely switch from DOS 3.2 to DOS 3.3 and back. DOS 3.2 disks can be converted to DOS 3.3, unless they are copy protected in certain ways. If so, they can still be run with DOS 3.3, but you must first boot with a special BASICs disk that is provided with the upgrade. This means that most commercial programs now available will require a double boot for use, an inconvenience that for now may

continued on next page

continued from previous page

outweigh the advantages of the file manager program. A possible advantage mentioned earlier is the availability of the Z-80 Softcard's 16-sector disk, if you have that product.

Unless you need extra space on your disks for file storage, don't assume that DOS 3.3 is a necessary upgrade.

ATARI SOFTWARE

THREE DIMENSIONAL GRAPHICS PACKAGE

by Tim Hays

Construct data base by entering geometric coordinates, then view from different angles. Four programs. Low resolution requires 8K, high resolution 16K, demonstration program, 24K. Atari 400 or 800.
\$29.95

COLLISION

by Mark Pelczarski

Collision is an Apple program that requires 16K and Applesoft in ROM.

You may recognize this program as an arcade-type game that has also gone under the name "Head On." The game board consists of five concentric tracks, each covered with mines that are worth points to you when you pick them up. Your vehicle travels around the track counterclockwise, while the computer has a vehicle moving clockwise on a collision course with you. Fortunately, there are four points in the track where you may change lanes to avoid the oncoming vehicle by steering with the paddle control. You may also double your speed by holding down the paddle button (use paddle zero).

Each mine that you pick up is worth one point. Occasionally, the computer's vehicle will drop special bonus mines that are worth five points each. When you clear an entire rack you are given a new, complete one. If at any point you think you've got the game mastered, wait until you try the third rack. (No one, to date, has made it past three.)

The program itself uses a table of three shapes. The first is a regular mine, the second is a bonus mine (which is larger), and the third is the rocket-like vehicle. It also uses POKEs and PEEKs for storing the board's status, instead of an array that would take more space and be more time-consuming in operation. Oh, and for those of you who cringe when they see one of my programs in anticipation of a few dozen lines of shape table, there's only one DATA statement in this entire program! (I'm learning how to avoid droves of phone calls.)

Collision - Variables

A,A\$,B - used in poking shape table into memory.

C - count of how many mines are left.

DC,DD,DY - direction (1-4) of the computer 1, computer 2, and you.

HS - high score.

I - loop counter.

L - pointer to memory locations.

LC,LD,LY - level in track; 1-inside, 5-outside.

R - random number to choose whether new mines appear.

RK - number of racks cleared.

S - start of the board table in memory.

SC - score.

SW - if the computer has two vehicles, this tells which has the next move.

T - how many moves you get (doubles when paddle button is pressed).

X,Y - coordinates used in setting up board.

XC,YC,XD,YD,XY,YY - x,y coordinates at any time of computer1, computer2, and player.

Z - working storage, used to minimize the number of long computations.

1120 NEXT

```

Instead of using an array to store the board status, 299 bytes are used to store the contents of each location on the board: 0 if empty, and 1 if there's a mine. The board is 23 by 13, and the proper location is found with the formula $S+X*13+Y$, where S is the start of the table. This technique saves both time and space.

The Lazy Man's Shortcut to Machine Language!

Tiny Comp.

by David Bohlke

A BASIC **Compiler** in BASIC! Run your source program in BASIC, compile it into FAST Z-80 Code and execute the compiled version — all without reloading. 26 integer variables, GOTO, GOSUB, END, REM, RND, LET, +, *, /, IF, THEN, <, =, >, INKEY\$, CLS, PRINT@, CHR\$, PEEK, POKE, Compiled programs may be saved via TAPEDISK.

Supplied with game program, "3D TIC TAC TOE", which uses all of the TINY COMP statement set and is ready to compile.

Manual includes several sample programs as well as thorough documentation of the Compiler for those who like to know "how things work" and for those who might even wish to EXPAND on TINY COMP's capabilities.

Tape version: \$19.95 Disk version: \$24.95

BOWLING

APPLEBOWLER

from
COM-SOFT

(Submitted by Phillip Case)

Applebowler for the Apple works with 16K memory and requires Integer BASIC in ROM.

APPLEBOWLER is a one or two player 16K full color graphics program which takes you to the lanes without leaving your living room. Also with this program you need not worry about straining yourself.

To play, the first thing you do is enter the number of players and the difficulty level (1-3). The difficulty level determines the speed of the position indicator. Once started, all further input is from the paddle buttons only.

If only one person is playing, then be sure to use paddle zero. The high score to date is 273, see if you can beat that.

VARIABLES:

MATRIX VARIABLES:

- A(1-10) = Indicators to tell if pin is still standing.
- C(1-13) = 1st player's individual frame scores.
- C(14-23) = 2nd player's individual frame scores.
- B(1-10) = 1st player's total cumulative scores.
- B(14-23) = 2nd player's total cumulative scores.

NON-MATRIX VARIABLES:

- V = Number of players.
- T1 = Difficulty factor.
- K = Player turn indicator.
- X = Path of ball down alley & misc. logic.
- G = The current frame in play.
- S = Sound producing address.

Engineer is for an 8K Atari with a joystick

Have you ever had the urge to build a bridge but just couldn't find the time or place to construct one? If so, then this simulation is for you.

The object of this game is to successfully build a bridge from the ground up. You have been hired by the San Francisco Public Works Commission to rebuild the famous Golden Gate which was recently destroyed by a powerful invasion from space. You must connect the two blocks at the top of the screen. You do so by placing beams from the bottom until you can support the connecting beams across the top.

There are only a few rules, as you are your own boss. You must have the right end of the beams supported by either another beam or the rocky cliffs on the side. The only other item to be aware of is the ever-present inspector, who will walk up and down during construction. All he asks of you is that you lay beams below his feet

only (so you can't drop one on his head).

The game itself is simple to play and win, so the challenge is in completing the entire work in as few days as possible. To play, all you need is an 8K Atari with one joystick, which goes into the leftmost slot.

VARIABLES

DA---days of construction so far.
X,Y---location of inspector
M,N---location of pointer on screen
W---if 1 then move inspector left, if 0 then move him right

MAD SCIENTIST

by Thomas Hamlin III

Mad Scientist is an S-80 program requiring at least 16K.

Have you ever felt the urge to go adventuring, but were foiled by a severe deficiency of giants, dragons, and mad scientists in your neighborhood? Well, here's your chance!

It will be your task to enter the mad scientist's haunted house, rescue the fiend's beautiful daughter, and get out of the house before it's blown sky-high after about 225 turns. It won't be easy! The daughter's room cannot be entered until a certain event has occurred. Secret passageways will bar your path. Monsters will pop up at inopportune moments and try to kill you, as is their custom. The directional compass in the lower corners of the screen won't show you everything!

You get things accomplished in this game by use of one - or two - word keys such as "GO NORTH" and "SCORE." Finding these will be part of the fun. Let it be a challenge to you!

NUMERIC:

BU 1 when fence on, else -1.
DA 1 when have daughter, else 0.
FL 2 before door passed, 1 just after, 0 after door passed.
F2 1 after fence goes on, else 0.
GS 1 if ghost, 0 if skeleton.
LF 1 if no weapon, else 0.
MV moves gone (score).
NR prospective next room.
OE 1 when door passed, else 0.
OL room you're in for monster random reposition routine.
PP Print position to start input.
RM room you're in.
SH ammo left.
TIME multiplied by 100 for delay loop.
WZ 1 when trap door just passed, else 0.
X flashing "ENTER" timing, array initialization loop.
XE cursor-blink timing loop.
XP directions obvious (for compass) loop.
Y array initialization loop.
Z program wait loop.

CURSOR BLINK AND LINE INPUT ROUTINE DISSECTION

This routine has many advantages over the usual INPUT statement and is one you will probably wish to include in your own programs. The blinking cursor draws attention to the fact that input is required. Leading blanks, colons, commas and quotation marks may all be input. No question mark is automatically generated and there is no messy linefeed when you hit ENTER. Nurse! Hand me my scalpel!

5000 Print the cursor at the assigned position plus the length of the string being input. If no key is hit for 40 iterations of the XE loop, print a blank over the cursor. If no key is hit for 40 more iterations, start over.

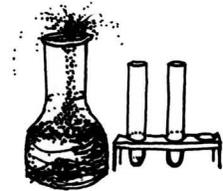

5010 If the key hit was ENTER, print a blank where the cursor is and return to the main program.

5020 If the key hit was backspace, start over if the entered string has no length; if it does, truncate the

rightmost character, print blanks where the string was, print the new string and start over. Note that this line is necessary as otherwise the string would look shorter, but would actually have a backspace added to it.

5030 Add the key to the end of the input string, print the new string, and start over.

Note also that the input string must be nulled before this routine is accessed, i.e., WH\$="".

VARIABLE TABLE

ARRAY:

A room connections in order, N, E, S, W, U, D.

AS\$ room descriptions.

AR rooms where special things happen - i.e., door shuts behind you. AR (Room #) = 1 for special rooms.

GW\$ monsters.

M new direction accessible when secret passage found.

MO new room accessible when secret passage found.

MOS\$ moveable objects.

SG\$ killed-monster messages.

ZE print positions for compass dots.

STRING:

CO\$, UD\$ N, E, S, W, and U, D compasses, respectively.

EF\$, NM\$, TD\$ special messages.

GM\$, OD\$ special commands.

MO\$ object to move.

WAS\$ direction to go.

WH\$ command input - built from WY\$.

WP\$, RU\$ game over-play again? inputs.

WY\$ letter input.

Lines 5-80: Program set-up: initialization of variables and printout of instructions.

ST80 has a smart terminal package for you!

All four programs include the ability to use an unmodified TRS-80 keyboard to produce RUB, ESC, and other control characters for time sharing, software control of the RS-232-C board, repeat key, bell, software support for the three most common upper/lower case hardware conversion, and line printer output.

ST80* UC

Preset parity, word length, and baud rate (regardless of switch settings on the RS-232-C board) for THE SOURCE, MICRONET, and FORUM 80, automatic testing of the RS-232-C board, and even spooling of prepared messages on tape directly into FORUM 80 using a basic program supplied as a line listing. 4K Level II cassette, \$24.95

ST80*

Reprogram your RS-232-C board from the keyboard, and run at different baud rates. Note: does not have auto testing of the RS-232-C or tape spooling. 4K Level II cassette \$49.95

ST80*D

Connection time clock, option of user-created translation tables for keyboard, gathering and pre-formatting data to be sent directly from disk to host computer, spooling of received files to disk or printer, editing of received files, and auto logon. Use it with VTOS 3.1, and get device-driven I/O, job logging, and chaining. 32K disk programs, \$79.95

ST80*III

ST-80 D with extra utility programs. 32K disk program, \$150.00

ON-LINE SYSTEMS HI-RES ADVENTURES

For 48K Apple II and Apple plus
MACHINE LANGUAGE

**BOTH
ADVENTURES
CAN BE SAVED!**

#1 Mystery House

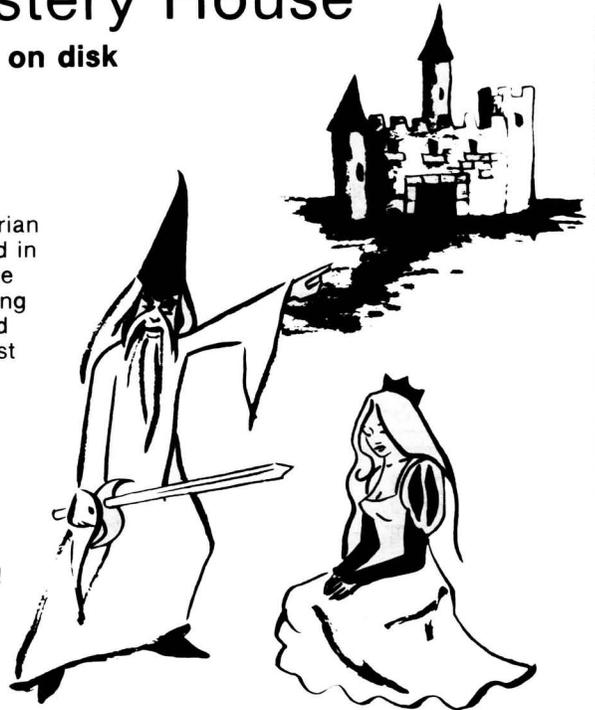

\$24.95 on disk

You are transported to the front lawn of a large, old Victorian house. Upon entering the house you find yourself enmeshed in murder, mystery, and intrigue from which you cannot escape until you solve the puzzles. One by one your friends are being murdered and it is up to you to find out who the killer is and why he is bent on mayhem. But watch out, for the killer just might find you first! As you explore the house you will encounter puzzles to solve and hazards which must be overcome. The secret passageway might lead you to the answer.

*Over 100 Hi-Res pictures for playing and watching your adventure!

*All rooms in the house appear in full Hi-Res graphics, complete with objects you can carry, throw, drop, or ???

*Speak to the computer in plain English - over 300 words!

#2 The Wizard and the Princess

\$32.95 on disk

A princess in distress! Only you can rescue her from the clutches of an evil wizard and save your life. But to find the wizard and his castle, you must first cross deserts, mountains and oceans to reach an island, encountering strange beasts along the way. You will have to learn magic, navigate at sea, and search for buried treasure. This epic game should provide months of pleasure.

*Hundreds of Hi-Res pictures!

*Full 21 color Hi-Res graphics!

*By far the most ambitious graphics game ever written for the Apple.

ATARI®

ATARI®

STRATEGY PACK I 6404

Roman Checkers. This ancient game has been a favorite for hundreds of years. It couldn't be easier to play, yet playing the game well takes skill, cunning, and strategy as you try to out-think your opponent.

Frame up. Try to out-manuever your opponent or play against the computer in this game of wits and calculated strategy. You will alternate selecting numbers and controlling your opponents choices. Joysticks are optional.

2 programs on cassette..... \$19.95

STRATEGY PACK II 6405

Target Chase. Choose a partner or challenge the computer to this fast action, catch-or-be caught adventure.

Tunnels. In this electronics hide-and-seek, only the computer knows where you will appear next.

Survival. Intercept your opponent before you crash or are devoured.

Snake Hunt. Fast maneuvering and quick response are essential to capture - or escape from - your opponent. Joysticks are required.

4 programs on cassette..... \$19.95

SKILL BUILDER I 6406

Bingo Duel. This fast-action skill game for one or two players provides an exciting challenge, because young children and adults can compete equally. The computer adjusts to match your skill and problems are specifically selected to help you gain speed.

Number Hunt. Matching numbers is easy enough for young children, yet this computer game quickly advances in difficulty to challenge the experts. Joysticks are required.

2 programs on cassette..... \$19.95

WALL STREET CHALLENGE 6402

This computer simulation of the stock exchange is easy to play and always challenging. Invest in several corporations ranging from Municipal Power and Light, a blue chip stock that usually provides steady growth, to Offshore Industries Limited, a high-flying speculative stock that is certain to change often. Stock charts, and the Dow Jones show you the trends. Both 8K and 16K memory versions are included.

Cassette\$14.95

ALL STAR BASEBALL 6401

This computerized version of America's favorite sport is full of fast action fun. Each player takes a turn at bat while the other player is both pitcher and the outfield.

The innings, score, and even errors are calculated by the computer and displayed on the official scoreboard. Balls, strikes, and all plays are called with absolute precision. Joysticks are optional for both players. Both 8K and 16K memory versions included.

Cassette..... \$14.95

MIND MASTER 6403

This classic strategy game takes on a new dimension as the computer designs the hidden problems and reports the results of each guess. Multiple players may compete against the computer and each player may select the level of difficulty that matches their skill, ability, and patience. This program also contains a formula for solving logic problems. Create the answer and watch the computer use deductive logic to discover the secret code. Both 8K and 16K versions.

Acorn Software and Leo Christopherson combine to bring you . . . **DUEL-N-DROIDS**

You are the Fencing Master and your android is the raw material you use to claim top honors in the Tournament. All you need to do is train him (her, it?). To do so, you make the android duel with the machine's androids. Once he is trained to your satisfaction, just enter him in the Tournament and sit back to watch the fun.

Features include:

- * **Sound Effects**
- * **Extensive Graphic Displays**
- * **Multiple Playing Levels**

Christopherson is the author of such programs as Android NIM, Snake Eggs, and Bee Wary. Don't miss out on the chance to add this great action game to your software library.

COLUMN CALCULATOR 4.1

by David T. Gray

COLUMN CALCULATOR is a "word processor for numbers," a number processor designed to be used like a desk calculator. It is different than a calculator in that it can handle large blocks of information as if handling one number at a time. The work space can be thought of as a large matrix with rows and columns much like an accountant's spread-sheet. Each column or row can be labeled. The cursor can move around the worksheet. Data can be easily entered into the columns; and the columns can then be moved around. Columns can be overlaid from an existing data file on disk. One column can be added, subtracted, multiplied, divided, or raised to a power of another and the results put in another column. Columns can be compared to one another (if column A is greater than, less than, equal to, not equal to column B, then put the contents of column C into column D). Columns can be totaled, or set with a constant, and any column can be sorted, carrying the rest of the columns with it. A predefined function (series of computations) can be defined, thereby pre-programming the worksheet. Enter the data, execute the function, and print the results. The COLUMN CALCULATOR is an all-purpose data manipulator.

The statistical section provides analysis of the data. The analysis includes simple statistics (mean, median, mode and standard deviation), linear regression, simple correlation, histogram and the T-test.

The information can be printed out on the line printer in a compressed format at any stage in the development of a data base. Thus, it can be used as a finished report or as a copy of the worksheet to permit the filling in of additional data for later entry into the data base. The data base can be saved on disk and recalled at a later date for modification or for generating a report. Any column in a file on disk can be referenced and added to the current worksheet. This is particularly useful for generating composite reports.

All user communication with COLUMN CALCULATOR uses FLASH, the line input/editor routine. This enables the user to not only key in his instruction to COLUMN CALCULATOR, but to edit errors or data as well.

By connecting an amplifier and speaker to the cassette aux output from the computer, the user can hear data entry feedback sounds which enable him to enter information into his worksheet without constantly watching the screen for visual feedback.

Information may be reviewed at will by scrolling up, down, left or right. Everything appears on the video display screen as it occurs, thereby eliminating guesswork.

ASTEROIDS IN SPACE

If you liked "Invaders," you'll love ASTEROIDS IN SPACE by Bruce Wallace. Your space ship is traveling in the middle of a shower of asteroids. Blast the asteroids with lasers, but beware - big asteroids fragment into smaller asteroids! The Apple game paddles allow you to rotate your space ship, fire its laser gun, and give it thrust to propel it through endless space. From time to time you will encounter an alien space ship whose mission is to destroy you, so you'd better destroy it first! High resolution graphics and sound effects add to the arcade-like excitement that this program generates. Runs on any Apple II with at least 32K and one disk drive. On diskette - \$19.95

The Right Tool for the Job.

STAD RAMWARE

Unlock the power of the Z-80 with STAD Symbolic Trace and Debug

A powerful monitor for the TRS-80 with special Debugging. Single Step through the machine language programs or set up to three breakpoints, and look at this display format!

For tape and disk systems, 16, 32, and 48K on one cassette.
\$24.95

EDITOR/ASSEMBLER PLUS MICROSOFT

Plus what? Well, you get the features of the T-Bug and the original editor/assembler plus macros and conditional assembly, plus extra commands like substitute, move, copy, and extend, plus Z-Bug, a powerful debugging monitor with 8 level breakpoint capability. \$29.95

RSM 2/2D SMALL SYSTEMS SOFTWARE

22 commands to control your TRS-80 Z-80 processor! Examine ROM, test RAM, program in machine language read/write machine language tapes, and much more! RSM-2 tape loads at top of 16K Level I or II. RSM-2 disk includes 3 versions for 16K, 32K and 48K. RSM-2: AN ADVANCED TAPE MONITOR FOR 16K TRS-80s. \$26.95

RSM-2D: THREE MONITORS FOR TRS-80 disk systems.
\$29.95

Z-80 ZAP/CMD RAMWARE

Powerful disk modification utility in machine language allows you to READ, DISPLAY, MODIFY, WRITE, and COMPARE disk sectors. It will calculate Hash Index Codes for any filespec and tell you where to put it (ever have a HIT read error?). You can recover killed disk files. Search for a byte and have it identified with a flashing cursor. Convenient to use, with cursor controlled by arrows, paging forward and backward, toggle between same sector on different disks and between Z80ZAP and DEBUG. Do disk backups, apply patches and fixes, and explore your disk.

Program on disk for minimum 16K 1 disk system, with instruction manual. \$29.95

ULTRA-MON INTERPRO

The first intelligent monitor available for the TRS-80. Ultramon is the first ROM independent machine language monitor which puts you in COMPLETE CONTROL with exclusive INTERPRETIVE EXECUTION.

Each instruction is individually fetched, decoded, disassembled, and analyzed by Ultramon's "BRAIN" so that your efforts cannot "Bomb-out" and so that you can put breakpoints anywhere . . . You can even put breakpoints in ROM.

ULTRA-MON displays, disassembles, traces (hard-copy trace disassembly, too!) lineprints, modifies, relocates memory, and even relocates itself with its commands. This 13-page documentation SHOWS YOU HOW TO DO IT.

Totally ROM independent, Ultramon will work in both the old and the newer ROM and will not be affected by any lower case modifications.

Cassette. \$24.95

ATARI PROGRAMMING HINT

Any ATARI program which does not use any keyboard input and has an execution time of over nine minutes and seven seconds initiates the color change routine. After this time the color registers are changed every few seconds. This prevents any one particular phosphor in your television's picture tube from being worn out.

If not wanted, this color change routine can be overcome by inserting

POKE 77,0

in a frequently used portion of the program. This will reset the counter that keeps track of how long it has been since the keyboard has been used.

Robert Schommer
Maplewood, N.J.

S-80 PROGRAMMING HINT

Here is a subroutine which allows "full screen" graphics to be printed out on a Quick Printer II. Anyone owning a Quick Printer II will know that it is not supposed to be able to print graphics.

The one problem I had was that the "QPII" has a maximum of 32 characters per line. Thus, to get a "full screen" printout, I had to print it in four strips!

But for "one shot" printouts it is very handy.

The routine is easily modified so that any section of the screen you want can be printed, ignoring what you don't need, just by changing the range of the FOR/NEXT loops - but watch it! Line 3010 must have 32 total loops, no more, no less, in order to maintain the proper format to the printer. But that 32 can start anywhere!

TRENCH

by Tim Hays

TRENCH

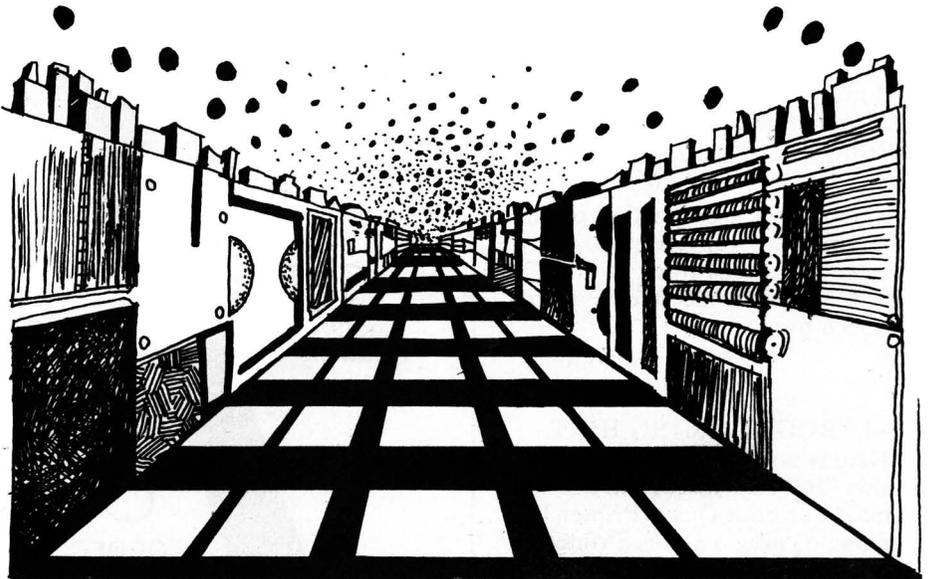

Trench requires 1 Atari joystick and 16K memory.

The object of this program is to destroy the Death Star by maneuvering your ship away from a crossfire until you reach the exhaust vent of the Death Star and fire your photon torpedos down the trench.

In the beginning you are already in the trench, flying down the corridor at your ship's top speed. There are three laser posts located on the left and right walls, and on the floor bottom. These lasers flash by you and fire on your ship at random intervals. The frequency of the fire from the laser posts is determined by the level of difficulty you choose, (1-19), with 1 being the hardest. All three lasers will aim at you independently. Each will fire at the mid-point between you and the last spot fired upon. As long as you keep your ship moving away from the three laser shots, and keep track, you should not get hit.

You will be able to see the number of miles to go at the bottom of your screen. This will be higher at more difficult levels of play. When the distance to go reaches 20, the on-board attack computer will be activated, the lasers will stop firing at you, and the end of the trench will come into view. You now have to quickly line up the center (one pixel) of this well so that the exhaust vent is exactly in the center of your sights.

When you approach the last 30 miles, set your ship close to the center so that you can line up the approaching target more easily. When you do have everything lined up, you must fire on the vent after the bottom wall is below the bottom of your sights and the target is close enough to be hit accurately, (the computer will say, 'FIRE NOW!'). If you succeed in hitting your target, you must immediately pull back on your joystick to pull up and out of the

trench. If you don't do this, you will run into the wall and be destroyed. Upon pulling out of the trench, the screen will go back to normal mode and show a window view of your ship moving out of the trench, and then switch to an aft view showing the Death Star being destroyed.

During your flight down the trench, remember that if you go too close to the sides of the corridor or the floor, you will run into them and be destroyed. If you go off the top of the screen, you will be out of the trench and your mission will be aborted.

Variables used in TRENCH
NOTE: Many of these variables are used more than once, or for more than one item storage or loop.

letters:

- 'A' Looping (FOR - NEXT).
- 'B' RND GOSUB of Laser fire, dependant on 'R'.
- 'C' Screen refresh (redraw what was erased by ship & lasers).
- 'D' "X" Position of upper-left laser post.
- 'E' "Y" Position of upper-left laser post.
- 'F' "X" Position of upper-right laser post.
- 'G' "Y" Position of upper-right laser post & "X" size of the target wall.
- 'H' "X" Position of bottom

laser post & "Y" size of target wall.

- 'I' "Y" Position of bottom laser post.
- 'J' Looping.
- 'L' Length of time until ship runs into wall.
- 'R' Input level of difficulty.
- 'T' Miles left to target.
- 'U' FOR-NEXT loops, control var., color locate var.
- 'X' Ship positioning.
- 'Y' " " "
- 'Z' Used as a TRUE/FALSE var. (eg. IF Z=1 THEN GOTO. . .).
- 'STRIG' Status of joystick trigger.
- 'JS' Joystick positioning status.
- 'Z1' used the same as "Z".
- 'L1' looping (nested with "L").
- 'U1' nested looping with "U".
- 'J1' wait looping - nested with "U1" above.

PERSONAL SOFTWARE

VISICALC

Students and professors, small businessmen and tycoons, all rave about Visicalc. Permits you to dispense with pencil, paper and calculator — instead, you can have an “electronic sheet” to do your calculations, projections, and planning. You can calculate sales projections, income taxes, personal budget, cost estimates, engineering changes — even balance your checkbook. Visicalc is partitioned into a matrix of rows and columns. At each position in this matrix you can define a title, formula, or number. By writing on your “electronic sheet,” you can set up individualized charts, tables, and records. For example, you can design your own sales forecasting format to assist in making the important “What if?” business decisions such as: “What would happen if sales increased by 10%?” “What if delivery time were decreased by two weeks?” “What would be the result if I produced 500 widgets this month instead of 600? What if I produced 700?” With Visicalc to assist you in performing these calculations, you can save countless hours.

Visicalc requires 32K Apple II with one disk drive.

CCA DATA MANAGEMENT SYSTEM

Comes with complete, illustrated manual in a three-ring binder. Can handle up to four disk drives. DMS is written in BASIC, with instructions for writing your own programs to use DMS files, including I/O routines. Permits you to create, add, update, or delete files easily. You can search any field for any data, or sort by any field. Print reports, selecting any fields in any order, and maintain totals and subtotals on any numeric fields. You can print mailing labels. Print records selectively; for example, only customers with New York addresses. Codes printed on the screen refer you to the manual for explanation at all times. There is a Scan function to report statistically on a file.

You might ask how many accounts are overdue and receive a report that stated ten records found in 200 records scanned (5% of a file). DMS automatically tests lineprinter ready state to avoid system lockup. Provides printer alignment pattern for labels. A warning is issued if you try to compact data without creating a backup (You can ignore the warning).

Applesoft ROM disk 32K \$99.95 (plus \$2.00 shipping charge)

Satisfy your craving for invasion games

INVASION

Now you can continue to play this popular arcade game even after you run out of quarters! Shoot down the invading aliens, but protect your guns from their bombs.

Great sound and graphics. (Sound requires external amplifier.)

16K Level II cassette \$9.95 (plus \$1 shipping)

32K Disk \$14.95 (plus \$1 shipping)

software**

SUPER INVASION

Fifty-five aliens advance and shower you with lethal, writhing electric worms. As you pick off the aliens one by one, they quicken their descent. They whiz across the screen, wearing away the parapets which are your only defense, coming closer and closer to your level. SUPER INVASION is the original invasion game with the original moon creatures.

DRAWING AND DESIGN

by Joan Truckenbrod

ROTATION TECHNIQUES Part I

Figure rotation is one of the basic methods used in computer graphics for transforming shapes and forms. There are many applications for rotated figures in creating visual compositions and animated sequences. A toy top is a good example of an object rotating in place as it spins around on the center post. A car making a U-turn is rotating around a point. The reflector on a bicycle wheel rotates around the hub of the wheel as the bike is pedaled. These examples are representative of one type of rotation, in which the objects are revolving around a point, that is, an axis perpendicular to a flat plane. Figures or objects can also rotate in other directions. A boat on the ocean, for instance, can rotate around three different axes, one axis is running through the center of the boat lengthwise, one axis through the center of the boat crosswise, and a third running through the center of the boat perpendicular to the horizontal deck. A boat can rise and fall in the water sideways, backwards and forwards, as well as revolving around in a circle on top of the water. This article will discuss the first type of rotation in which a figure is rotated around an axis that is perpendicular to the drawing plane. The next article will discuss two additional types of rotation, in which the axes are flush with the drawing plane and the figures can be rotated in three-dimensional space in various directions.

In the first type of rotation, the video screen will be the drawing plane and the axis of rotation will be perpendicular to this screen. Rotation of a figure around this axis changes the orientation and possibly the position of the figure, but not the shape of the figure. To visualize this change in the orientation of rotated figures, write your name on a piece of paper, lay the paper flat on the table, and then turn the paper around. As you turn the paper around, the

appearance and legibility of your name changes.

The basic element of the rotational process is the axis of rotation. The rotated figure revolves around a point on the screen that represents this axis. This point is analogous to the hub of a wheel or the center of a pinwheel. In using the microprocessor, the center point is the intersection point of the perpendicular axis of rotation and the video screen. Figures on this screen are defined by X and Y coordinates. The rotation formula is applied to all of the points defining a figure, and the rotated figure is drawn on the screen. With the use of FOR/NEXT loops any number of sequentially rotated figures can be created and drawn. The rotation formula rotates all figures in a counter-clockwise manner, around a specified center, beginning with the position of the figure on the screen. The basic formula for this type of rotation is as follows:

X and Y arrays contain the coordinates defining the figure or shape

A = the angle of rotation.

$R = A / 57.2958$ (translation of angles into radians).

XC = the X coordinate of the desired center point.

YC = the Y coordinate of the desired center point.

Rotated X = $(X(I) - XC) * \cos(R) + (Y(I) - YC) * \sin(R) + XC$

Rotated Y = $(Y(I) - YC) * \cos(R) - (X(I) - XC) * \sin(R) + YC$

There are various ways to apply this formula to achieve different visual effects. Figures can be rotated in place, or they can be rotated and redrawn in a circular path on the screen.

SUPERIMPOSED ROTATION

Rotation of a figure in place is like a ballerina twirling around on her toe. This type of rotation consists of identifying the center location of the given figure and rotating the figure on that point.

The axis of rotation is positioned in the middle of the figure and the figure is spun around that axis like a pointer on a game dial. The figure or shape is coded in X and Y coordinates in the desired location on the screen. The center point of the figure is calculated by a routine listed in the sample program in subroutine 3000, and the X and Y values of this point are assigned to XC and YC. The angle of rotation is established by the value assigned to A in the FOR/NEXT loop in line 95 of the sample program. The number of rotated figures is controlled by the limit set in this loop in coordination with the step value. This program line will cause the figure to be drawn five times, incrementing the angle of rotation by ten degrees each time.

```
FOR A = 0 to 40 STEP 10
```

The rotated figures can be sequentially drawn on top of one another as illustrated in figure 1, or the screen can be erased prior to the drawing of each new figure.

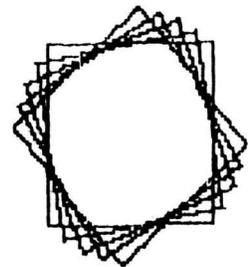

Figure 1

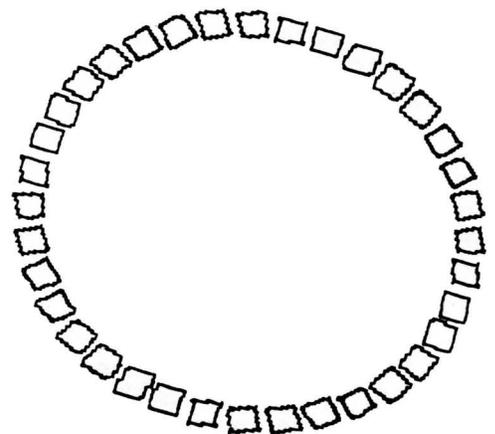

Figure 2

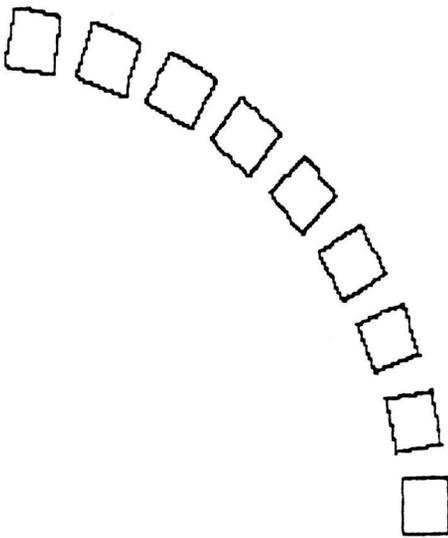

Figure 3

ROTATION AROUND A NEW CENTER

A figure or shape can also be rotated around any point inside or outside the figure, within the limits of the screen or beyond these limits. Rotation around an external point creates a circular path or arc of figures on the screen. This circular path will begin at the original location of the figure. If the external point is within the central area of the screen, a circle will be constructed by the rotating figures. An example of this is shown in figure 2. If the point is outside of the limits of the screen or on the perimeter of the screen, an arc will be constructed as illustrated in figure 3. Otherwise, in specifying the location of a point of rotation, carefully coordinate the location of the center with the original location of the figure to avoid exceeding the limits of the screen as the figure is rotated and redrawn.

SPECIAL DELIVERY with EXTRACT

A 100% Machine Language Word Processor from:

We can't stop improving and expanding the capabilities of your TRS-80*. By using SPECIAL DELIVERY with EXTRACT and either Electric Pencil* or Radio Shack's Scripsit* you can get even more out of your computer. From just one package you will get all this:

MAILFORM

Create MAILFILE: The ONLY complete name and address list entry/editor program written in machine language.

MAILRITE

Print letters written with either the Electric Pencil* or Radio Shack's Scripsit* inserting information from a MAILFILE into the letter for personalizing and addressing.

EXTRACT

Take out information from the MAILFORM, the machine language mailing list. Find the names you need by Zip Code, Street Address, Gender, Age or any other way!

SORT

In-Memory sort on an entire address list using any field as the key.

LABEL

Prints labels from MAILFILE

CONVERT

Make MAILFILE from RS mail list.

SPECIAL DELIVERY will run on your TRS-80* with TRSDOS*, NEWDOS* or any other TRS* - like DOS.

PROBLEM. INT(X^N+X SIN(X^2),X) SOLUTION.

MICROSOFT

We set the standard.

Surprised? You should be. Because until now, no software could solve anything but the most basic arithmetic problems without a series of complicated steps.

A big disadvantage? If you use a microcomputer for scientific, educational, or engineering applications, you bet it is. That's why Microsoft has come up with a solution of its own. muMATH.

muMATH is a symbolic math package you'll recognize immediately as a major advance in microcomputer software.

muMATH lets you efficiently and accurately perform the most complex mathematical operations: Exact, infinite precision rational arithmetic. Unbound variables. Complex expressions (even equations may be included). Exact solution of algebraic equation. Plus logarithmic, exponential and trigonometric simplifications and transformations.

That's right. It does in an instant what took you years to learn at school. Rational arithmetic. Algebra.

Trigonometry. Transcendental functions. Symbolic differentiations (including ordinary and partial derivatives.) Symbolic Integration of Indefinite and definite integrals. Matrix arithmetic and algebra.

Trigonometric simplifications? But of course. Just type: ?SIN(2*Y) * (4*COS(X) 3 - COS(3*X)=SIN(Y) * COS(X=Y=#P1) - COS(X-Y); Then instantly muMATH returns:

@4*SIN(Y)*COS(X) * COS(Y).

Adding fractions? Need you ask?

?1/3-5/6=2/5=3/7;
@419/210.

muMATH is written in muSIMP, which is included in the muMATH package. muSIMP is an applicative, recursive language, ideal for describing complex mathematical concepts.

Because of its highly interactive nature and hierarchical structure, muMATH is an excellent math teaching device, from simple arithmetic to calculus.

FORUB Runtime Library
Complete documentation**

FORTRAN PACKAGE

For TRS-80 users who want FORTRAN programming capability

Because FORTRAN is a popular language that has been around a long time, and because Microsoft's TRS-80 FORTRAN is an ANSI Standard FORTRAN, users will instantly have access to the vast number of applications programs already written in FORTRAN. After all, FORTRAN is the standard language used throughout the industry for scientific, mathematical, engineering, statistical and modeling programs. FORTRAN is probably the answer if Level II BASIC has presented any limitations for your applications. For instance; it's easy to interface directly to machine language subroutines, double precision scientific functions are included, FORTRAN can support any I/O device, and because it's a compiler, FORTRAN is faster (3-10 times faster!) than BASIC. Floating point and I/O subroutines from FORTRAN's library may be incorporated in subroutines, plus users can create their own library of the subroutines used most often. Using the text editor and linking loader, data files and FORTRAN files can be created and edited, loaded and linked together—that means much more extensive use of the TRS-80 disk hardware.

The TRS-80 FORTRAN Package is fully compatible with TRSDOS. The TRS-80 FORTRAN compiler can compile approximately 1200 lines per minute in a single pass and requires a minimum 32K TRS-80 disk system. The compiler generates a fully symbolic listing of the machine language that is generated—a great way to learn assembly code! At the end of the listing, the compiler produces an error summary and tables showing the addresses assigned to labels, variables and constants. **\$95.00 + \$2.50**

ASSEMBLY LANGUAGE PACKAGE

**MACRO-80 Macro Assembler
LINK-80 Linking Loader
EDIT-80 Text Editor
CREF-80 Cross Reference Facility
Complete documentation**

For TRS-80 users who want assembly language programming capability

The TRS-80 Assembly Language Development System from Microsoft is the perfect, low-cost package to help you get started with assembly language programming.

The macro assembler accepts Z-80 op-codes and supports a complete Intel standard macro facility including IRP, IRPC, REPEAT, local variables and EXITM. **\$95.00 + \$2.50**

COMPUTER SHOPPER, the new buy, sell, and trade publication, is ready to help you with the latest information on personal, small business and large-system computers, accessories and software.

Each ad-packed issue is full of bargains you are looking for. Included are ads from individuals throughout the United States who are selling their good, pre-owned equipment just so they can trade-up to new equipment coming on the market.

But, COMPUTER SHOPPER'S bargains won't be yours unless you subscribe. This useful, money-saving publication can become your way to communicate with other buyers, sellers, and traders all over the nation.

Whether you are a hobbyist or a part-time user, COMPUTER SHOPPER will put you in touch with the nationwide computer marketplace in time for you to take advantage of bargain opportunities.

Have something to sell? A COMPUTER SHOPPER subscriber probably wants to buy it.

Looking for a part, component or even a complete system? A COMPUTER SHOPPER subscriber probably wants to sell it.

COMPUTER SHOPPER is THE marketplace for anything in computers and is read by thousands of people who are ready to buy.

COMPUTER SHOPPER offers a unique format in which classified ads are categorized for fast location of specific items. Combining this with low individual ad rates — 10 cents a word —

makes it the ideal place for buyers and sellers to communicate. And, its mix of individual, dealer, and manufacturer ads enable subscribers to find what they want at the best price possible.

COMPUTER SHOPPER will work for you in other ways, too. If you are just thinking about getting into computers, it can help you learn product availability and prices before you make a decision. And, through the timely ads, COMPUTER SHOPPER will keep you abreast of changes in the market which could create bargain opportunities for you.

BUT COMPUTER SHOPPER cannot work for you unless you subscribe.

Want to look us over first? We'll give you your first issue FREE and then bill you for the next 12. If you are not convinced COMPUTER SHOPPER suits your needs, just write "cancel" on the invoice and return it.

And, to let COMPUTER SHOPPER start working for you right now, with a paid subscription we'll also give you a FREE classified ad to sell your pre-owned equipment or to find equipment you want.

If you don't need to use the free classified ad now, use it anytime during your subscription.

Subscription: \$10/year, 12 issues plus your first free one. Bank cards accepted. Money back guarantee.

LOWER to UPPER CONVERSION

LOWER TO UPPER CONVERSIONS is for S-80 disk systems.

by Robert F. Nicholas

Ever since I had a lower case modification added to my computer, I've been writing just about everything in upper and lower case. It makes programs much easier to read while debugging. Text stands out clearly from the rest of the BASIC commands.

However, it seems that most software publishers and magazine editors prefer line listings to be in the normal all-upper case mode. This is reasonable since that's what

most computer hobbyists have at the present time. (Obviously if the lower case capability is necessary to the proper functioning of the program for some reason, then that would be acceptable.)

As a result, before I submit anything for consideration, I have to convert all of the lower case back to upper case. One way would be to do it by hand. Rather ridiculous considering that the computer can do it quite nicely.

The following program does just that. Save a copy of your program to be converted in ASCII format. For example, if your program is named "TREK79," then save another version by typing SAVE "TREK79/ASC," A. Be sure

you end up with your original program and a second version of it in ASCII.

Now run the conversion program and answer the questions when prompted. It will load your ASCII version in line-by-line, scan for any lower case, convert them to upper, indicate how many it's found so far and then save the program to disk again in the process. When it's all done, it will load the converted program in for you to review and resave to disk in non-ASCII format, if you desire.

(Note: At SoftSide we run our listings directly from working copies of programs, and we do have lower case capabilities -Ed.)

VTOS 4.0 VIRTUAL TECHNOLOGY, INC.

Operating System Diskette with Operator's Guide

Supports Large (8") drive, Double Sided drive, Double Density drive, 80 Track drive, and Winchester technology fixed drive. Supports double-speed processor clock modifications.

Features include: Improved overlay structure, General purpose output spoolers, Keyboard Type-ahead, User definable keys, Built-in Graphic string packer (lets user enter graphic symbols into a BASIC program from the keyboard through the use of the CLEAR key), Dated file, Marked files, File transfer by class, Built-in SYSTEM command containing lower case display driver, Non-BREAKable AUTO and CHAIN commands, Wild-card DIRectory (permits user to locate all files of a certain classification such as /BAS'), ALLOCate command

for pre-allocation and non-releasability of file space, and MEMORY command for directly setting upper memory limit.

User may SYSGEN a custom VTOS system configuration containing special I/O drivers, device LINKing and ROUTing, SPOOLing and DEBUG tasks.

Dynamic file name defaults in APPEND.

COPY and APPEND commands execute up to 300% faster.

Variable Length file support is incorporated which automatically blocks short user data records both within a sector and across sector boundaries, thereby taking maximum advantage of disk file space.

No security disk needed to make backups or to run the system \$99.95

Three from Potkin.

Wargamer's delight

1). Kriegspiel II.

A much improved two-player version of the original. Kriegspiel II is a wargamer's delight. Choose the number of mountains (up to 200) and pick a scenario from the 9,999 possible, and then watch the computer set up the pieces, towns, mountains and a river. To win, you must enter the capital city of your opponent or reduce his fighting strength to below half of your own

S-80 Level II, 16K cassette \$14.95

2). Up Periscope

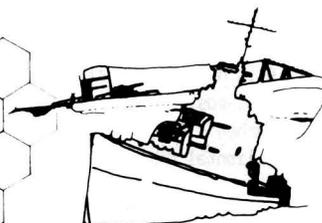

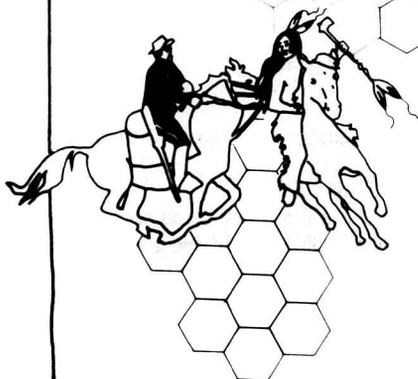

The author of the popular Kriegspiel II has done it again. This time the action takes place at sea with one player controlling the submarines while the other attempts to sail around RADSHA Island, with at least three of his fleet surviving the attempt. This realistic wargame includes sonar, depth charges, and torpedos.

S-80 Level II, 16K cassette \$14.95

3). Warpath.

The Indians are on the warpath! The Chief, along with 24 braves, is out to take the garrison at the fort, or at least to stop reinforcements from entering the stockade. The General, with his 14 troopers, is trying to relieve the garrison before the flag is captured. The player determines the scenario through placement of boulders that provide both shelter and obstacles. Favorite scenarios may be replayed.

**BOING! is for any Level II
TRS-80 or 8K Atari with joystick.**

You have been thrust into the employment of an over-exuberant trampolinist: The infamous Bouncing Barney!

Barney doesn't bounce as "normal" people do, because "normal" people tend to stay on

the trampoline. Barney likes to bounce all over the gymnasium. He can bounce off the walls and ceiling with no problem, but he doesn't seem to realize that bouncing off the floor is harmful. While under the employment of the management, you have been given the awesome responsibility of keeping the trampoline under Barney. There are ten skill levels, numbered zero to nine, depending

on how exuberant you want Barney to be. Be warned! Level zero is so easy you might be tempted to go right to level nine. Don't do it! Level nine is for people who like seeing their futile efforts result in messy consequences. Stick to the lower levels until you have developed your proficiency somewhat, for Barney's sake.

S-80 Version

Instructions

10 PRINT"GAME. SEE HOW LONG YOU CAN KEEP BARNEY BOUNCING."
11 PRINT:PRINT"GOOD LUCK!! (BARNEY NEEDS IT!)"
    Strobe the keyboard until user hits a number from zero to
    nine. This number is the skill level. A$ contains the number
    in string form.
12 PRINT@917,"SKILL LEVEL? (0-9)";:CLEAR70:RANDOM:A$=INKEY$
13 A$=INKEY$:IFA$=""THEN13ELSEIFASC(A$)<48ORASC(A$)>57THEN13
    H = (skill level + 2) / 4, a number from 0.5 to 2.75 which
    will be used to determine how much Barney Bounces to the
    left or right. B$ is the trampoline. It has two blanks on
    either side so that when it moves (in two space increments),
    it wont leave part of itself behind in the previous position,
    which otherwise would not be cleared. PRINT@2,STRING$(59,131)
    prints the ceiling of the gymnasium. Line 16 prints the walls
    of the gymnasium by POKEing into video memory the value of a
    full graphics block (191) at the proper locations.
14 H=(VAL(A$)+2)/4:CLS:FORX=1TD4:B$=B$+CHR$(131):NEXT
15 B$=" "+CHR$(135)+B$+CHR$(139)+" ":PRINT@2,STRING$(59,131)
16 FORX=15361TD16263STEP64:POKEX,191:POKEX+59,191:NEXT
```

Barney is represented on the screen as a single graphics block. A is his horizontal position (from 4 to 119) and B is his vertical position (from 1 to 44). To give the illusion of motion, Barney's image is updated many times each second. C is the horizontal distance he moves for each update. This value does not change until Barney hits the trampoline or either wall. If Barney has just hit the trampoline, the new value of C will depend on which part of the trampoline he hit. If Barney hit a wall, then C is changed to -C. For positive, negative, or zero values of C, Barney moves left, right or straight up and down respectively. To prevent straight up and down motion from happening on many consecutive bounces (thus allowing the player to keep scoring until there is a blackout or a dinner bell), C is randomized enough to make it almost impossible to send Barney straight up more than once.

D is the vertical distance Barney moves on each update. This number is decreased by 0.4 because Barney follows a parabolic curve rather than a straight line. If Barney hits the ceiling D is set to the negative absolute value of D. Why not simply -D? There is a rare case, which happened to me once, in which yD turns out to be positive and Barney walks from wall to wall on the ceiling, never coming down. When Barney hits the trampoline, D is set to E (see below). If D is positive, Barney is ascending. If D is negative, Barney is descending. If D is zero, Barney has reached the top of his bounce. E is the new D value at the beginning of each bounce. At every bounce E is increased by a random amount between 0.0 and 0.5. If Barney hits the ceiling E is decreased by a number between 0.6 and 1.6 so that he won't hit it again on his next bounce. The larger E is, the higher Barney's next bounce will be. P is the PRINT@ position of the trampoline (from 960 to 1012).

```
17 E=1.5:P=986:A=62:B=43:D=1.5:C=RND(2)*H-(3*H/2):PRINT@P,B$;
    Barney walks out to the trampoline, climbs up and walks into
    the center.

POCKET TAPE DUBBER

by Edward Ting

Almost everyone has experienced tape loading troubles with their computers, but the TRS-80 is notoriously bad. Dropped bits and misread data are all too common problems.

To solve these problems, products are now on the market which not only enhance loading, but allow you to dub tapes. Unfortunately, these devices cost upwards of \$50, which is quite steep. So most of us suffer.

The Pocket Tape Dubber is a simple device that performs the same functions as commercially-available units. It even dubs tapes for you! The main difference is that the Pocket Tape Dubber will save you loads of money. It can be built for under \$5. If you're an electronics hobbyist, run to your parts box! The components used in construction are among the most common. If you need help with parts, here is a list.

TESTING AND OPERATION

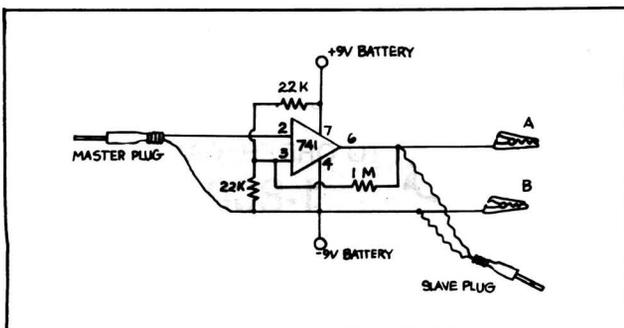

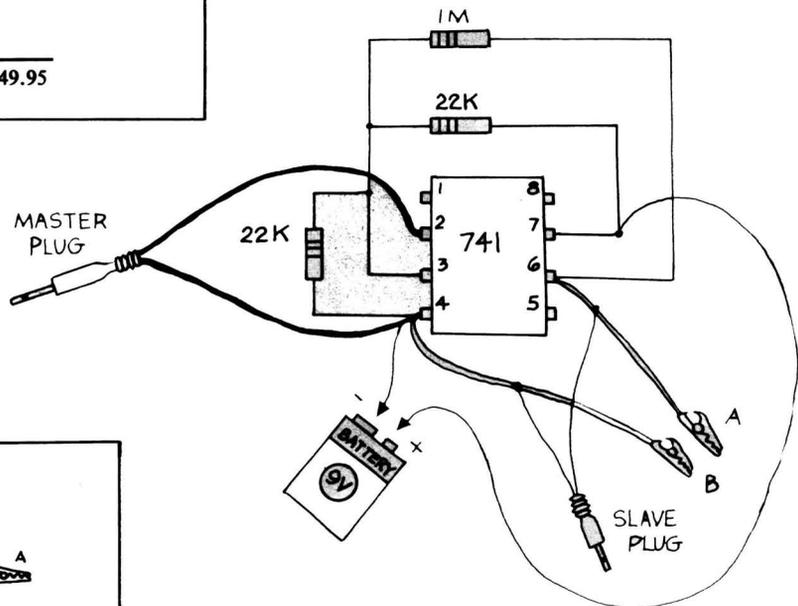

When the unit is completed, it's time for some testing. Plug the 'Master' plug into the ear jack of your master recorder (the one you normally use). Connect the two alligator clips to the black plug from the computer. Be sure that clip B connects to the tip terminal and clip A connects to the body terminal. Also be sure these two clips are not touching. With the power on, load tapes as usual. Note: The two gray plugs from the computer connect normally.

If you wish to copy the tape

being played, place a blank tape in the slave recorder. Plug the 'Slave' plug into the AUX. jack. Press "record" and "play." Load the tape from the master recorder as usual. The tape will be copied onto the slave recorder's tape. Remember that the computer will not stop the slave recorder, so you will have to do this manually. Note: This process is intended only for making back-up copies for your own use. Please don't abuse this function.

COPYCAT+

by A. Douglas Werbeck

Instructions for COPYCAT+

COPYCAT+ is a **S-80** program requiring **4K** of RAM.

The May issue of **SoftSide-80** carried my little program called **LIVEKEYS** on page 12.

During the past two months I have received several letters from subscribers with favorable comments (thank goodness) concerning my program. I had even forgotten the line listing included my address; it was very flattering to receive the response.

All of the letters contained suggestions. Some of them requested me to write an additional "line or two" of program that they could insert in order to add various features, the most popular one being a cursor.

Adding the features was going to be easy enough; however, **SoftSide** had bestowed upon my program the title of "World's Smallest Word Processor." That meant I had to watch length and not challenge **SCRIPSIT!** It seemed to me that the world's smallest anything needs to be able to fit on the video without annoying scrolling, so that was the goal I set for the revised program. The changes got so extensive I decided to rename the program **COPYCAT+**.

1. Type the first line of your text on the keyboard. Do not type more characters than your printer is set to print on one line of paper.

For instance, if your printer is set to print 64 characters per line on paper, you could type up to one video line (also 64 characters). If your printer was set to print 100 characters per line on paper, then you could type up to a line and a half on the video screen (64=32 + 96).

2. You can correct a typing error if you **DO NOT** type past it. After you have typed an incorrect character, immediately type #. That will make the error disappear. You can now proceed to type in the correct character and continue. You cannot use the # in normal operation; it is a reserved character.

3. Whenever you wish to transfer your video line to the printer, just press **ENTER**. A bar will appear at the end of the dumped line on video to indicate that it has been dumped so you do not need to constantly glance at the printed copy to see where you are.

4. **END**

X-WING

by Chris Freund

For the thousands who have enjoyed X-Wing Fighter, X-Wing II presents a totally new element in the game!

You are the pilot of an X-Wing fighter . . . Your Mission, Destroy the Death Star!

Where X-Wing I left Death Star looming on the screen, **X-Wing II** lets you guide your fighter into the trench, find the exhaust port, aim and fire — all the while avoiding enemy fighters. Excellent graphics, 12 levels of play, and extensive **INKEY\$** commands make this one of our most exciting "real time" games.

Feeling Diskusted with your System?

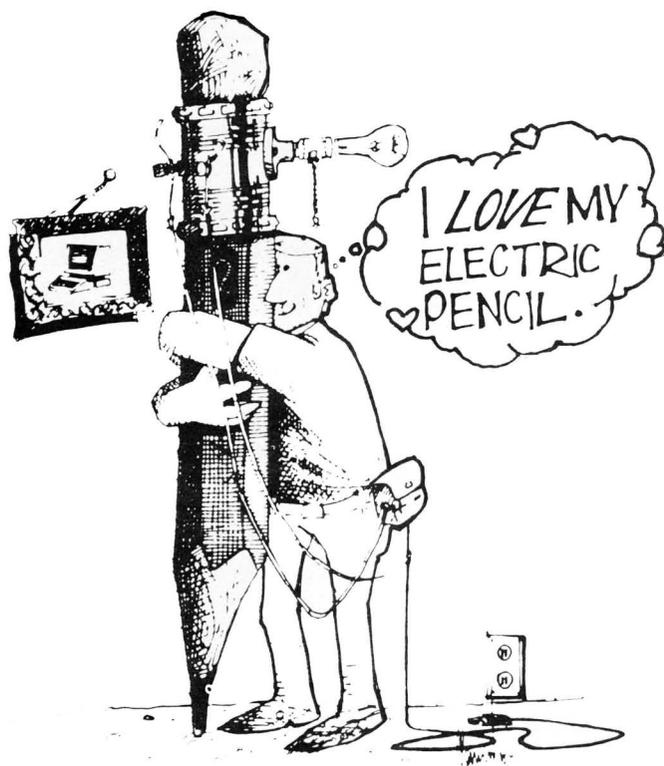

You say you worked 35 hours on a Cadets in Space program only to see it vanish as your disk just turned and turned? And the program you use for the household budget suggests that Junior's allowance be raised to \$25,000 a week? Does your Electric Pencil seem to have a broken point?

Don't panic. Don't despair. Heave a sigh, perhaps, and maybe even shed a tear. It'll clear your eyes out and prepare you for the solution to your woes: **TRS-80 Disk and Other Mysteries**, by Harvard C. Pennington. Your troubles will soon come to an end.

Pennington tells you most of what you need to know about TRS-80 disk drives; how disks are organized, how space is allocated, how files are located on disks, and the tools that one may use to look at disk files and directories. The book both provides a general understanding of how disk systems operate, and discusses and explains how to fix disk problems such as lost files, Electric Pencil bugs and other seemingly impossible tangles.

On top of that, Pennington's drawings and his language are engaging and quite amusing. If you can beat knowledge and fun in one package, then seek elsewhere. If not, then **TRS-80 Disk and Other Mysteries** might be for you.

“Did you know you could get SoftSide’s programs already typed?”

With *SoftSide* Disk and Cassette subscription you can get each month’s TRS-80, Apple, or Atari programs delivered on disk or cassette with every issue of your *SoftSide*. No more hours of typing. No hunting for typing mistakes. The programs for your computer are tested and ready to go the day you receive them.

To order, use the form below or call 1-800-258-1790 toll free. In N.H. call 673-5144. Be sure to specify TRS-80, Apple, or Atari.

If you already receive *SoftSide* magazine, you will receive credit for the remainder of your subscription toward your new cassette or disk subscription.

TRS-80, Apple, and Atari are trademarks of TANDY, APPLE COMPUTER CO., and WARNER COMMUNICATIONS, respectively.

Make your Apple Blossom...

HIGHER GRAPHICS

Complete shape generation, manipulation, and utilization tools for the programmer. Add sophisticated graphic displays and effects to your programs. Shape Maker, Table Combiner, Screen Creator, four shape tables, three high-res displays, and the machine language graphics routines required to produce high resolution graphics on the Apple II.

48K disk, Integer BASIC... \$24.95

HIGHER TEXT

Print characters in upper case, lower case, upside down, sideways... in any color! Script, Old English, foreign languages and special scientific symbology included. Define your own specialized or decorative character sets. Customized displays without any hardware modifications!

Apple II, Apple II Plus, Machine Language Disk... \$35.00

MAILING LIST DATA BASE

Enter and store a list of names with associated addresses, phone numbers, comments, and code designations. List, search, edit, print labels; convert prior mailing lists. Up to 225 records can be loaded on line at any time.

Applesoft, 48K disk... \$34.50

MODIFIABLE DATA BASE

Now you can have a data base program that can be customized at will. The variety of applications is endless, limited only by your imagination. Machine language searches and sorts permit immediate access to files. Data manipulation - editing, printing, or deleting - has never been easier.

Applesoft, 48K disk... \$79.50

PROGRAM LINE EDITOR

Full feature line editors for both Integer and Applesoft programs. Program development and modification can now be completed in a tenth the time previously required.

Apple II, Apple II Plus, Disk... \$40.00

DUNGEON CAMPAIGN

Lead an expeditionary force into an underground labyrinth, but watch out for monsters, pitfalls, poisonous vapors, evil sorcerors, and those pesky pterodactyls!

16K Integer

Cassette... \$14.95

Disk... \$17.50

WILDERNESS CAMPAIGN

Free the kingdom of Draconia from the clutches of the Evil Necromancer! Your party must overcome obstacles and defeat hostile inhabitants. Explore tombs, temples, castles, and ruins, in search of gold and magic.

48K Integer

Cassette... \$17.50

Disk... \$19.95

Both adventures on disk, 48K Integer... \$32.50

(in N.H. call 673-5144)

Elegance and power in a mathematical language.

APL

by Phelps Gates.

Software you can rely on.

Now, a high-level, scientific programming language that doesn't cost \$200 or \$300 for the home computer. This language is perfect for the mathematician, scientist, engineer, or anyone who just wants to learn a new language. The power of this language is in its strong mathematical operations, especially with regard to matrices and vectors. Programs requiring matrix multiplication or other matrix problem solving that would require hours of programming time in BASIC are solved quickly and with minimal effort in APL. Not only is math made easy, but upon gaining proficiency in APL programming various string manipulations become child's play.

To aid in learning APL, lessons are included on the disk. Starting from the basics, you are brought step by step through the various programming techniques involved with APL. These lessons act as a tutor in a "learning by doing" atmosphere which will have you "talking APL" in no time. Also available is the book, **APL: An Interactive Approach**, which reinforces many of the examples given in the lessons. The book also provides additional insight into APL programming.

LIMITATIONS

Due to the absence of the special APL character set on the TRS-80, APL-80 uses shifted letters to represent the various APL characters. These shifted letters are identified on the screen by a graphics block before each shifted letter. If you have a modified TRS-80, a lower case driver is included to display the shifted letters on the screen.

In addition to the keyboard limitations, there are several other limitations. Lamination, domino, and matrix inverse are not implemented but can be derived with user-defined functions.

Multiple specifications must be split into two statements unless the left-hand assignment is to a quad. This also applies to implied multiple specifications.

Reduction and reshape (p) are not permitted for empty arguments; the argument of add/drop may not be scalar; empty indices are not permitted.

A quad (q) can't be typed in response to a quad (nor can the name of a function which itself gets input from a quad). Quote-quad (m) is permitted.

No more than 32 user functions can be defined in a single workspace and a function may not contain more than 255 lines.

A comment (c) must occupy a separate line: a comment can't follow a function statement on the same line.

In the tape version, arrays are limited to five (5) dimensions.

FEATURES

APL-80 on disk contains the following features:)SAVE and)LOAD workspace on disk;)COPY other workspaces into current ones; Return to DOS for directory or commands without losing your workspace; Send output to lineprinter; Five workspaces of lessons included; Sequential and random files; 15 digit precision; Monadic and dyadic transposition; Easy editing within FUNCTION lines; Latent expression (FUNCTION can "come up running" when loaded); Tracing of function execution; Real-time clock; User-control of random link; Workspace is 25587 bytes (in 48K machine); Arrays may have up to 63 dimensions.

COMMANDS APL-80

APL-80 supports the following commands: Absolute value, add, and, assign, branch, catenate, ceiling, chr\$/asc, circular, combinatorial, comment, compress, deal, decode, divide, drop, encode, equal, expand, exponential, factorial, floor, format, grade down, grade up, greater, greater/equal, index generator, indexing, index of, inner product, label, less, less/equal, logarithm, maximum, member, minimum, multiply, nand, negate, nor, not, not equal, or, outer product, peek, poke, quad, quote quad, random, ravel, reciprocal, reduction, reshape, residue, reverse, rotate, scan, shape, sign, system, subtract, take, transposition.

SPECIFICATIONS

Minimum system requirements: 32K disk system (48K recommended) Includes APL-80, Five workspaces of lessons, instruction manual.

Price: \$39.95 on disk

Reduced feature: 16K Level II tape version, no lessons.

Transpositions, format, and inner product not implemented. Reduced domain for some functions. 6 digit accuracy.

Price: \$14.95 on cassette

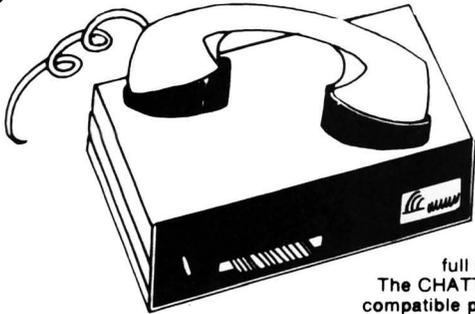

APL: An Interactive Approach

Price: \$16.95 (\$3.00 shipping charge)

The Chatterbox

A TRS-80 Interfacing Alternative

The CHATTERBOX is a unique packaging combination of the presently available COMM-80 I/O Interface for the TRS-80* and an acoustic modem. This one box is all that is required to turn even a barebones 4K TRS-80* into a full time-sharing terminal.

The CHATTERBOX includes built-in programmable 50-19200 baud serial port, a Centronics compatible parallel printer port, a 300 baud acoustic originate modem, and a spare TRS-BUS expansion connector. It comes complete with power supply, ribbon cable and connector, user's manual, and terminal software for immediate operation. When the modem is in use, the complete data conversion is automatically routed to the serial output port where it can be logged on a printer.

The CHATTERBOX is the only peripheral needed to allow a TRS-80* to communicate with time-sharing systems such as MICRONET and the SOURCE.

It is completely hardware and software compatible with existing TRS-80* products and connects either to the keyboard connector or screen printer port on the RS Expansion Interface. Features: Full 8-bit parallel port; RS-232-C serial port (up to 19,200 baud); Acoustic modem; TRS-BUS connector for future expansion; Connects to Keyboard or E.I.; Includes terminal software; Users manual; Power supply. \$259.95

The Doubler™ PERCOM

This proprietary adapter for the TRS-80* Model I computer packs approximately twice the data on a disk track.

Depending on the type of drive, you can store up to four times as much data - 350 Kbytes - on one side of a minidiskette as you can store using a Tandy standard Model I computer drive.

Easy to install, the DOUBLER reads, writes and formats either single- or double-density disks; you can continue to run all of your single-density software, then switch to double-density operation at any convenient time.

Included with the PC card adapter is a TRSDOS* compatible double-density disk operating system, called DBLDOS™, plus a CONVERT utility that converts files and programs from single- to double-density or double- to single-density format.

Each DOUBLER also includes an on-card high performance *data separator circuit* which ensures reliable disk read operation.

The DOUBLER works with standard 35-, 40-, 77- and 80- track drives rated for double-density operation.

\$219.95 postpaid.

CASSETTES

The cassette tapes used for recording data are composed of two parts: the cassette shell and the tape loaded into the shell. The shell can be either a 5-screw or sonic welded type with a non-magnetic leader or a magnetic leader (so called leaderless cassettes). The shell used in our cassettes is of premium quality, 5-screw, with non-magnetic leader. The choice of non-magnetic leader may confuse some people, but there is a valid reason. There is a splice required to connect the magnetic tape to the leader at both ends of the tape. A person recording program material or data, using a leaderless tape, stands to drop a bit of data at the splice point. Not all leaderless tapes have the splice and you have to be very careful when buying this type of data tape. We use standard leader to avoid the confusion, and unhappy customers when the first recording on the tape is always bad.

The tape used in our cassettes is of studio quality. The same type of tape is used by some studios for making master recordings. The magnetic tape used in the cassette is the true heart of the cassette. You can have the best shell made, but with low quality tape it is still junk.

The cassettes offered here have been chosen for the highest quality components consistent with a practical cost level.

Cassettes come packaged in boxes of 10. They are offered in 10 and 20 minute lengths.

C-10 \$6.95 + \$1
 C-20 \$7.95 + \$1

DISKETTES

We offer two levels of diskettes: certified and non-certified. The certified diskettes have been put through a test to check the entire working surface for bad spots. These diskettes are certified error-free by the manufacturer. If you require assurance of every diskette being perfect, then the Dysan certified diskette is for you.

The BASF company invented magnetic tape from which the very large and varied industry of today has grown. We offer the BASF premium quality (non-certified) Diskette. These diskettes enjoy one of the lowest reject rates of any manufacturer (all our disk-based software is duplicated on BASF).

We are also offering diskettes from 3-M SCOTCH. These come encased in a touch (PVC) jacket which resists handling damages. They are certified 100% error-free. Their low modulation provides better signal stability.

BASF:
 Box of 5 \$19.95 + \$1
 Box of 10 \$34.95 + \$2
 Box of 100 \$299.00 + \$3

3-M SCOTCH:
 Box of 10 \$39.95 + \$2
